Acknowledgments

This book embodies a perspective which has been shaped by mentors to whom I owe great debt and gratitude. My undergraduate advisors Professors Eleanor Rosch and John Searle made the disciplines of psychology and philosophy come alive in the minds of impressionable students at U.C. Berkeley, and together they elucidated the compatibility between subjective and objective perspectives. As Advisor throughout my doctoral training at the University of Oregon, Professor Michael I. Posner ushered our cohort of fledgling researchers into the field of cognitive neuroscience with a limitless vision for the possibilities of this field which repeatedly challenged my own more restricted understanding. Professor Jon S. Driver (and U.K. Medical Research Council project grant G9123295) supported my work during the initial stages of this book at the University of Cambridge, where this volume was conceived amidst the stimulating buzz of experimentation on human attention across multiple sense modalities. For insightful tutorials in the consequences of brain pathology, I thank Dr. Allan F. Mirsky, Chief of the Section on Clinical and Experimental Neuropsychology at the National Institute of Mental Health.

My colleagues in the International Multisensory Research Forum have provided a wealth of advice and commentary, and to their collective expertise I am grateful. I also thank Tanner House and Lisa Korenman for help in preparing this manuscript.

I thank the reviewers who critically appraised one or more of the manuscripts which together comprise this volume: Matthew Beer, Scott Fischer, Mark Hallett, Loring Ingham, Chris T. Lovelace, Allan F. Mirsky, Ewald Neumann, Mark Price, and Mike Wohl. My greatest thanks go to the contributors to this volume, having taken upon themselves the challenge of explaining how conscious experience depends on brain functions.
