|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----|
| 2.1. Schematic diagram of the "threshold-mortality" concept redrawn from Promislow et al. 1999.                                                                                                             | 24 |
| 3.1. Age-specific mortality rates for 3 experiments.                                                                                                                                                        | 30 |
| 3.2. Smoothed age-specific mortality rates for 3 medfly mortality experiments plotted on a linear scale.                                                                                                    | 31 |
| 3.3. Distribution of the estimated slopes of the logarithms of age-specific mortality at 10, 30, and 45 days in each of 167 medfly cages with an average initial density of 7,200 adults (experiment 3).    | 32 |
| 3.4. Age-specific mortality rates computed for cohorts of 6 different initial numbers from $n = 25$ to $n = 100,000$ .                                                                                      | 34 |
| 3.5. Results of frailty model with 12 subpopulations and with a composite cohort.                                                                                                                           | 37 |
| 3.6. Smoothed male and female age-specific mortality rates from cohorts consisting of approximately 600,000 medflies of each sex.                                                                           | 40 |
| 3.7. Sex mortality ratios for medflies (male to female age-specific mortality ratios) using the smoothed rates shown in figure 3.6 and the survival sex ratio (ratio of male to female survival schedules). | 41 |
| 3.8. Mortality and survival sex ratios for medflies reared in solitary confinement.                                                                                                                         | 43 |
| 3.9. Male versus female mortality rates at 10 and 30 days for 167 medfly cohorts of approximately 3,600 individuals of each sex.                                                                            | 44 |
| 3.10. Male versus female expectations of remaining life at 0 and 30 days for 167 medfly cohorts of approximately 3,600 individuals of each sex.                                                             | 45 |
| 3.11. Ages of the last male and the last female to die in each of 167 medfly cohorts of approximately 3,600 individuals of each sex.                                                                        | 46 |
| 4.1. Graphic depicting age-specific cohort survival and lifetime reproduction for 1,000 individual Mediterranean fruit fly females.                                                                         | 56 |
| 4.2. Frequency distribution of the level of daily egg laying ( $> 0$ ) in 1,000 medfly females over 3 age periods relative to the total number of oviposition-days within the period.                       | 61 |

|                                                                                                                                                                  |    |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------|----|
| 4.3. Relationship between cumulative egg production in female medflies through 30 days and the total number of eggs each subsequently produced.                  | 62 |
| 4.4. Relationship between cumulative egg production in female medflies through 30 days and remaining life span.                                                  | 63 |
| 4.5. Lifetime reproduction vs. life span in 1,000 medfly females.                                                                                                | 64 |
| 4.6. Trajectories of age-specific mortality based on 1,000 individual medfly females.                                                                            | 65 |
| 4.7. Distribution of deaths in females that laid no eggs and fertile females.                                                                                    | 66 |
| 4.8. Smoothed 3-D plot showing the relationship between the age-specific reproduction of females rank-ordered from high to low lifetime reproduction.            | 67 |
| 4.9. Cross section of surface plot shown in figure 4.8 for the Mediterranean fruit fly at 4 levels of lifetime egg production.                                   | 68 |
| 4.10. Smoothed hazard rates for 33 female Mediterranean fruit fly cohorts maintained in either all-female or mixed-sex cages.                                    | 72 |
| 4.11. Mean hazard rates for the 33 female Mediterranean fruit fly cohorts shown in figure 4.10.                                                                  | 73 |
| 4.12. Event history charts for supine behavior in 203 male medflies relative to cohort survival.                                                                 | 79 |
| 4.13. Smoothed plots for the supine number recorded in the 2-hour observation period of each of 203 males aligned relative to time of death.                     | 80 |
| 4.14. Schedules of remaining life expectancy for male medflies for the cohort as a whole as well for males both prior to and after the onset of supine behavior. | 81 |
| 4.15. Schedules of active life and total survival for the male medfly cohort.                                                                                    | 82 |
| 5.1. Survival in a hypothetical cohort showing 3 types of densities.                                                                                             | 89 |
| 5.2. Smoothed age-specific mortality for male and female medflies at 3 different initial densities.                                                              | 95 |
| 5.3. Geometric rate of change in age-specific mortality for male and female medflies at 3 different initial densities.                                           | 96 |
| 5.4. Relationship between initial density and cumulative density for medfly density experiments.                                                                 | 98 |

# LIST OF FIGURES

xv

|                                                                                                                                                                                                                                                                 |     |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 5.5. Correlation coefficients for cumulative and current density vs. mortality at each age for male and female medflies.                                                                                                                                        | 99  |
| 5.6. Ratio of the sex-specific survival schedules for the low- vs. the high-density experiments.                                                                                                                                                                | 100 |
| 5.7. Ratio of the male medfly survival schedule to the female medfly survival schedule for each of the 3 initial cage densities.                                                                                                                                | 101 |
| 5.8. Daily age-specific death rates at specified densities for (A) the density experiment and (B) the density experiment and original 1.2 million medfly experiment combined.                                                                                   | 102 |
| 5.9. Composite of age-specific death rates for (A) the density experiment and (B) the density experiment and original 1.2 million medfly experiment combined.                                                                                                   | 103 |
| 6.1. Estimated hazard rates for 4 groups of medflies.                                                                                                                                                                                                           | 114 |
| 6.2. Estimated hazard rates obtained separately for each of 132 cohorts of medflies.                                                                                                                                                                            | 115 |
| 6.3. Peak-aligned estimated hazard rates from 0 to 25 days.                                                                                                                                                                                                     | 116 |
| 6.4. Smoothed hazard rates for 35 male Mediterranean fruit fly cohorts in each of 4 treatments.                                                                                                                                                                 | 122 |
| 6.5. Smoothed hazard rates for 35 female Mediterranean fruit fly cohorts in each of 4 treatments.                                                                                                                                                               | 123 |
| 6.6. Mean hazard rates for the 35 male and female Mediterranean fruit fly cohorts shown in figures 6.4. and 6.5.                                                                                                                                                | 124 |
| 6.7. Relationship between female and male life expectancy in all treatment cohorts for sugar-only and full-diet treatments.                                                                                                                                     | 131 |
| 6.8. Interaction plots for mean lifetime response in medfly diet experiments.                                                                                                                                                                                   | 132 |
| 6.9. Hazard rates response of female and of male medfly cohorts with access to either sugar-only or full diets in 1-of-3 different cyclical patterns or control.                                                                                                | 138 |
| 6.10. Log mean amplitudes measuring the oscillations in life table data shown for all cohorts.                                                                                                                                                                  | 140 |
| 7.1. Age-specific schedule of reproduction for female medflies maintained on a sugar-only diet, on a full diet (sugar + protein hydrolysate) throughout their lives, or on a sugar diet from eclosion and then switched to a full diet on days, 30, 60, and 90. | 147 |
| 7.2. Event history diagrams for survival and reproduction in the 5 cohorts of 100 females.                                                                                                                                                                      | 148 |

|                                                                                                                                                                                       |     |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 7.3. Smoothed age-specific probabilities of death for the 5 study cohorts starting at the time when they were first switched from sugar to a full diet.                               | 149 |
| 7.4. Trajectories of fecundity and mortality.                                                                                                                                         | 152 |
| 7.5. Lifetime and proportion of eggs left.                                                                                                                                            | 155 |
| 7.6. Survival schedules for flies in each of the 7 treatments and 3 controls.                                                                                                         | 163 |
| 7.7. Average number of eggs/female/day in the medfly study consisting of 7 treatments and 3 control cohorts.                                                                          | 164 |
| 7.8. Event history graphs of individual female reproduction in each of the 10 treatments.                                                                                             | 166 |
| 7.9. Patterns of egg production for composite egg-laying cycles averaged over the life course of all flies.                                                                           | 167 |
| 7.10. Relationship of lifetime egg production (response) and the predictors of female longevity, age of initial peak of egg production, and the height of the initial egg-laying peak | 172 |
| 8.1. Summary chart of all longevity data contained in <i>Longevity Records: Life Spans of Mammals, Birds, Reptiles, Amphibians and Fish</i> by Carey and Judge (2000a).               | 185 |
| 8.2. Observed and predicted record life spans for Old World primate genera.                                                                                                           | 191 |
| 8.3. Relationship between human growth rate and stage-specific mortality.                                                                                                             | 193 |
| 8.4. Event history reproductive chart for 500 randomly selected French-Canadian women rank-ordered by longevity after age 13.                                                         | 195 |
| 9.1. Relative life span for 9 mammalian orders.                                                                                                                                       | 213 |
| 9.2. Record captive life spans by body size for primate genera.                                                                                                                       | 214 |
| 10.1. Schematic of sexual reproduction in the protozoan <i>Paramecium aurelia</i> (redrawn from Clark 1996, p. 70).                                                                   | 226 |
| 10.2. Three long-lived animal species or groups that likely achieved their extended life span due to direct natural selection.                                                        | 228 |
| 10.3. The ant queen, a eusocial insect.                                                                                                                                               | 230 |
| 10.4. The life cycle of the mayfly.                                                                                                                                                   | 232 |
| 10.5. Predicted life spans of different hominoid species based on anthropoid subfamily values for body and brain mass regressions.                                                    | 235 |
| 10.6. Examples of how the timing and duration of different life-course events may change with increasing longevity.                                                                   | 242 |
