

Tables

1.1. Large-scale mortality studies on Mediterranean fruit fly and other tephritid fruit flies or parasitoid.	6
2.1. Main life table functions.	15
2.2. Life table parameters for Mediterranean fruit fly.	16
2.3. Selected mortality parameters and formulae, change indicators, and scaling models.	18
3.1. Number alive, age (days), and remaining life expectancy of medflies in each of 3 experiments.	29
3.2. Values of frailty z and proportions of flies at each level of frailty for the Gompertz model.	36
4.1. Number of female Mediterranean fruit flies alive at age x and fraction of initial number surviving to age x for cohorts maintained in either all-female or mixed-sex cages.	71
4.2. Number of female Mediterranean fruit flies alive at age x (for $x \geq 30$) and survival (l_x) normalized using number alive at 30 days for cohorts maintained in either all-female or mixed-sex cages.	74
4.3. Table of pair-wise comparisons for log-transformed remaining lifetimes for groups of virgin and mated medflies.	75
5.1. Summary of results for male and female medflies maintained in mixed cages at three initial densities—2,500, 5,000, and 10,000 flies per cage.	92
5.2. Average mortality ratio (SD) by sex for 3 density experiments from day 0 through 40.	93
5.3. Summary statistics for analysis of medfly cage density effects on mortality.	105
5.4. Correlation between the number of deaths before and after age x for 2 medfly experiments alone and combined.	106
6.1. Life expectancies at eclosion in days for male and female medflies.	113
6.2. Expectation of life in days (e_0), standard deviation (SD), and number of cages (n) for male and female medflies subjected to 4 different treatments.	120
6.3. MANOVA table for mean lifetimes, subject to different diets and irradiation treatments.	120

6.4. Results on treatment effects of diet and fertility separated by sex.	121
6.5. Average of the expectations of life at eclosion ($\bar{e}_0$) in days and standard deviations (SD) for 13 cohorts of medflies subjected to 1-of-3 different cycles of food availability and 1-of-2 different diets.	129
6.6. ANOVA table for mean lifetimes by sex in the medfly subject to different diets and starvation schemes.	129
6.7. Number of deaths by sex on days when food was present (food-days) and not present (non-food days) and the percent of all deaths on non-food days.	135
6.8. Percent of total deaths that occurred in experimental cohorts at different stages of the food deprivation cycle.	136
6.9. Means and standard deviations (SD) for log amplitudes of hazard rate oscillations by sex for intact or irradiated medflies maintained on 1-of-2 diets.	137
6.10. ANOVA table for mean log amplitudes of the hazard rate oscillations by sex in the medfly subject to different diets and starvation schemes.	137
7.1. Longevity and reproductive data for medfly cohorts given access to a full diet at different ages.	145
7.2. Life expectancy and lifetime reproduction (eggs/female) for medfly cohorts subject to different food cycles.	161
7.3. Mean and standard error for first egg peak and its location (age).	162
8.1. Heritability of life spans.	188
9.1. Categories of factors that favor the evolution of extended life span in insects, arachnids, and vertebrates: selected examples species or groups.	203
9.2. Evolutionary changes in wasp longevity and social complexity.	205
9.3. Evolved life span of ancestral hominids and modern humans.	215
