

Contents

§ 0. Introduction	1
§ 1. Background	3
1.1. Probability space	
1.2. Random variable and probability distribution.	
1.3. Sequence of events and r.v.'s.	
1.4. Law of large numbers.	
§ 2. Brownian motion.	14
2.1. Definition of Brownian motion	
2.2. Construction of Brownian motion	
2.3. Random Fourier series.	
2.4. Continuity of sample functions.	
§ 3. Additive processes.	31
3.1. Poisson process.	
3.2. Compound Poisson processes.	
3.3. Lévy processes	
3.4. Stable processes.	
3.5. Subordination	
§ 4. Stationary processes	62
4.1. Measures on function spaces.	
4.2. Extension theorems	
4.3. Definition of a stationary process	

4.4.	Hilbert spaces (L^2) and $\mathcal{F}$ arising from a stationary process.	
4.5.	Stationary processes with independent values at every moment.	
§ 5.	Gaussian processes.	86
5.1.	Definition of a Gaussian process	
5.2.	Examples of a Gaussian process.	
5.3.	Linear operators acting on Gaussian processes.	
§ 6.	Hilbert space (L^2) arising from white noise. . .	94
6.1.	Preliminaries	
6.2.	Gauss transform σ .	
6.3.	Realization of the multiple Wiener integral.	
§ 7.	Flow of the Brownian motion.	106
§ 8.	Infinite dimensional rotation group	113
8.1.	A subgroup arising from time change.	
8.2.	Shift.	
8.3.	Tension. (Dilation)	
8.4.	PLG $(2, \mathbb{R})$.	
§ 9.	Fourier Analysis on (L^2) , motion group and Laplacian.	120
9.1.	Fourier-Wiener transform.	
9.2.	Translations.	
9.3.	Infinite dimensional motion group $M_\infty(E)$.	
9.4.	Infinite dimensional Laplacian operator.	

§ 10. Applications	135
10.1. N. Wiener's theory for nonlinear networks.	
10.2. Stochastic differential equations.	
10.3. Canonical commutation relation.	
§ 11. Generalized white noise.	147
11.1. Poisson white noise.	
11.2. Poisson-Charlier polynomials.	
11.3. Stable white noise.	

Appendix

STATIONARY STOCHASTIC PROCESSES

WHITE NOISE

Professor T. Hida
