INTRODUCTION

vii

CHAPTER I

ONE-DIMENSIONAL ALLOCATION PROCESSES

SECTION

1. Introduction	3
2. Verbal Description of the Allocation Process	4
3. Construction of a Mathematical Model	4
4. Discussion	5
5. Calculus	6
6. Difficulties	7
7. Conclusion	13
8. Sensitivity Analysis	13
9. Dynamic Programming.	13
10. Functional Equations	14
11. The Principle of Optimality.	15
12. A Direct Derivation	15
13. Discussion	15
14. Computational Scheme	16
15. Nonuniqueness of Maximum	18
16. Dynamic Programming versus Direct Enumeration	19
17. What Difficulties Have We Overcome?	20
18. Flow Chart for General Allocation Process	21
19. Numerical Results	25
20. A Useful Device	26
21. Stability	27
22. A Cargo-loading Process	27
23. Mathematical Formulation	28
24. Discussion	28
25. Recurrence Relations	29
26. Discussion of Computational Procedure.	29
27. Reliability of Multicomponent Devices	31
28. Reliability via Component Duplication	33
29. A Mathematical Model	34
30. Parallel Operations	35
31. Conclusion	36

CONTENTS

CHAPTER II

MULTIDIMENSIONAL ALLOCATION PROCESSES

SECTION

1. Introduction	39
2. Allocation Processes Involving Two Types of Resources . . .	39
3. Recurrence Relations	40
4. Allocation Processes Involving Two Types of Constraints . . .	41
5. Recurrence Relations	41
6. Computational Aspects	41
7. Discussion	42
8. The Flyaway-kit Problem	42
9. Stochastic Aspects	43
10. Dynamic Programming Approach	43
11. Computational Procedure	44
12. Example	44
13. The Lagrange Multiplier	47
14. Geometric Origin	48
15. The Lagrange Multiplier as a Price	51
16. Use of the Lagrange Multiplier—I	51
17. Use of the Lagrange Multiplier—II	52
18. Reduction in Dimensionality	52
19. Equivalence of Variational Problems	53
20. Monotonicity in λ	54
21. Application of Lagrange Multiplier Technique—Advertising Campaign	55
22. Lagrange Multiplier Technique	57
23. Computational Results	58
24. Calculation of the Lagrange Multiplier	61
25. Pyramided Problems	64
26. Multidimensional Policy Space	65
27. The Reliability Problem	65
28. Introduction of Lagrange Multiplier	66
29. A Numerical Example	66
30. Flow Chart	68
31. An Extension	68
32. The Hitchcock-Koopmans Transportation Problem	70
33. A Mathematical Model of a Transportation Process	71
34. Discussion	72
35. Dynamic Programming Approach	73
36. Discussion	74
37. Reduction in Dimensionality	74
38. Increase in Grid Size	74

CONTENTS

SECTION

39. Three Depots and a Lagrange Multiplier	75
40. Example I—Two Depots, Ten Demand Points	76
41. Flow Chart, Two Depots	78
42. Example II—Three Depots, Ten Demand Points	78
43. Successive Approximations	78
44. Approximation in Policy Space	80
45. Successive Approximations—II	82
46. Successive Approximations—III.	83
47. Coupling Coefficients	87
48. Coarse Grid	87
49. Successive Approximations in the Hitchcock-Koopmans Problem	88
50. Convergence	89
51. Example 1—Relative Minimum	89
52. Example 2—Absolute Minimum	92
53. Stochastic Iteration	96
54. Conclusions	96
55. "Difficult Crossing" Problems	97
56. General Problem	97
57. Functional Equations	97
58. Discussion	98
59. Numerical Solution	98

CHAPTER III

ONE-DIMENSIONAL SMOOTHING AND SCHEDULING PROCESSES

1. Introduction	103
2. Smoothing Processes	103
3. A Particular Smoothing Process	104
4. Mathematical Formulation	104
5. Functional Equations	105
6. Discussion	105
7. Computational Aspects	105
8. Results.	106
9. Flow Chart	108
10. Some Graphical Results	108
11. "Nearest Neighbor" Problems.	114
12. Equipment Replacement	114
13. The Physical Process.	114
14. Dynamic Programming Formulation	116
15. Analytic Solution	116
16. Technological Improvement.	117
17. Dynamic Programming Formulation	118

CONTENTS

SECTION

18. Example	119
19. Other Formulations	123
20. A Warehousing Problem	125
21. A Mathematical Model	125
22. Recurrence Relations	126
23. Discussion	126
24. Preliminary Transformations	126
25. Analytic Structure.	127
26. Proof of Theorem 1	129
27. Discussion	130
28. A Numerical Example	130
29. Conclusions	131
30. The Caterer Problem.	131
31. Dynamic Programming Approach—I.	132
32. Dynamic Programming Approach—II	132
33. Analytic Solution for $q = 1, p = 2$	133
34. Analytic Solution for $q = k, p = k + 1$	134
35. Analytic Solution for $q = 1, p = 3$ —I	134
36. Analytic Solution for $q = 1, p = 3$ —II.	136
37. Analytic Solution	137
38. A Common-sense Solution	137
39. Inventory Problems	139
40. Discussion	140
41. A Further Reduction	141
42. Production Line Scheduling.	142
43. Mathematical Formulation	142
44. Dynamic Programming Approach	143
45. Determination of Optimal Ordering	144
46. An Example	145
47. Conclusions	145

CHAPTER IV

OPTIMAL SEARCH TECHNIQUES

1. Introduction	152
2. Unimodal Function	152
3. Optimal One-dimensional Maximization	153
4. The Fibonacci Numbers	154
5. The Golden Mean, an Aside	155
6. The Discrete Case	156
7. Zeros of Functions	156

CONTENTS

SECTION

8. Functional Equations	156
9. The Special Case $n = 1$	161
10. $n = 1, S = 0$	162
11. Description of the Computational Procedure	163
12. A Numerical Application—Comparing the Bisection Technique	164
13. Discussion	166
14. The Defective Coin Problem	168
15. The Two-coin Problem	168
16. Analytic Formulation	169
17. Values of $p(r;s;t)$	170
18. The Basic Functional Equation	171
19. Computational Procedures	172
20. Information Theory Considerations	177

CHAPTER V

DYNAMIC PROGRAMMING AND THE CALCULUS OF VARIATIONS

1. Introduction	180
2. Functionals.	180
3. The Formalism of the Calculus of Variations	182
4. Necessary Conditions.	184
5. Natural Boundary Conditions	185
6. Isoperimetric Problems.	185
7. Shortcomings of the Calculus of Variations	185
8. Two-point Boundary Value Problems	188
9. Constraints	188
10. Linearity	190
11. The Formalism of Dynamic Programming	190
12. The Basic Nonlinear Partial Differential Equation	191
13. The Euler Equation	192
14. The Legendre Condition	192
15. The Weierstrass Condition	193
16. Several Dependent Variables	193
17. An Isoperimetric Problem	194
18. Lagrange Multiplier	195
19. Natural Boundary Conditions	195
20. A Transversality Condition	196
21. The Erdmann Corner Conditions.	196
22. Implicit Variational Problems.	196
23. Inequality Constraints	198
24. The Hamilton-Jacobi Equation	199
25. Discrete Approximations	200

CONTENTS

SECTION

26. Discussion	201
27. Two-point Boundary Value Problems	202
28. Duality.	203
29. Conclusion	204

CHAPTER VI

OPTIMAL TRAJECTORIES

1. Introduction	207
2. A Simplified Trajectory Problem.	208
3. A Dual Problem.	209
4. The Minimum Time-to-climb Problem	209
5. Dynamic Programming Formulation	209
6. Analytic Solution	211
7. Computational Procedure.	212
8. A Sample Problem.	213
9. A Generalized Climb Problem	218
10. A Satellite Trajectory Problem	219
11. The Simplified Problem.	220
12. Mathematical Formulation	220
13. Analytic Solution	221
14. Dynamic Programming Approach—I.	221
15. Dynamic Programming Approach—II	222
16. Computational Aspects.	222
17. Numerical Results	224
18. Flow Chart	225
19. A New Guidance Concept.	225
20. Multistage Rockets	227
21. The Optimal Staging Problem.	227
22. Formulation	228
23. Higher Dimensional Problems.	228
24. A Routing Problem	229
25. Computational Aspects.	229
26. The n th Shortest Path	230
27. Conclusions	231

CHAPTER VII

MULTISTAGE PRODUCTION PROCESSES UTILIZING COMPLEXES OF INDUSTRIES

1. Introduction	234
2. A Two-industry Economic Complex	234
3. A Mathematical Model	235

CONTENTS

SECTION

4. Discussion	236
5. Dynamic Programming Approach	237
6. Search of Vertices	237
7. Reduction in Dimension and Magnitude	239
8. Computational Technique.	240
9. Steady-state Growth	241

CHAPTER VIII

FEEDBACK CONTROL PROCESSES

1. Introduction	245
2. The Classical Control Problem.	246
3. Deterministic Feedback Control	246
4. Time Lags	248
5. Formulation of Variational Problems.	248
6. Analytic Aspects	248
7. Discrete Version.	249
8. Functional Equations	249
9. The “Bang-bang” Control Problem	250
10. Nuclear Reactor Shutdown	251
11. Maximum Deviation	253
12. Maximum Range	253
13. Minimum of Maximum Deviation	255
14. Reduction in Dimensionality	255
15. Discussion	256
16. Stochastic Control Processes	257
17. What Constitutes an Optimal Policy?	258
18. Functional Equations	259
19. Computational Aspects.	260
20. Correlation	260
21. An Example due to Aoki	261
22. Games Against Nature	261
23. Adaptive Processes	262
24. Adaptive Feedback Control	263
25. Computational Aspects.	263
26. Communication Theory and Information	264
27. Utility a Function of Use.	265
28. Dynamic Programming Formulation	265
29. An Adaptive Process.	266
30. Dynamic Programming Formulation	266
31. Power Law	267
32. Logarithm Law	267
33. A Further Simplification, and Numerical Results	269

CONTENTS

CHAPTER IX

COMPUTATIONAL RESULTS FOR FEEDBACK
CONTROL PROCESSES

SECTION

1. Introduction	275
2. A Discrete Stochastic Process	275
3. Recurrence Relations	276
4. Choice of Parameters.	276
5. Discussion of Results.	277
6. A Final Value Problem.	278
7. Stochastic Version	278
8. Adaptive Process	282

CHAPTER X

LINEAR EQUATIONS AND QUADRATIC CRITERIA

1. Introduction	285
2. A Smoothing Problem	285
3. Discussion	287
4. A More Complex Smoothing Problem.	287
5. Slightly Intertwined Systems	288
6. Characteristic Values.	289
7. Stochastic Smoothing	290
8. Linear Control Processes with Quadratic Criteria—Deterministic Case	291
9. Stochastic Case	291
10. Reduction in Dimensionality	292
11. Linear Prediction Theory	293
12. Deterministic Case.	293
13. Stochastic Case	294
14. Correlation	295
15. Adaptive Prediction Theory	295

CHAPTER XI

MARKOVIAN DECISION PROCESSES

1. Introduction	297
2. Markov Processes	298
3. Markovian Decision Process.	299
4. Example—A Taxicab Problem	299
5. Analytic Formulation	300
6. Computational Aspects.	300
7. Asymptotic Behavior.	301

CONTENTS

SECTION

8. Discussion	302
9. Howard's Policy Space Technique	303
10. The Value Determination Operation	303
11. The Policy Improvement Routine	304
12. Solution of the Taxicab Problem.	304
13. The More General Problem	307
14. The General Solution.	308
15. Equipment Replacement Problems Revisited	308
16. A Tire Manufacturing Problem	308
17. Dynamic Programming Formulation	310
18. A Numerical Example	310
19. A Further Example	311
20. An Automobile Replacement Problem	312
21. A Simulation Technique	319
22. Connection with Linear Programming	319
23. Summary.	319

CHAPTER XII

NUMERICAL ANALYSIS

1. Introduction	322
2. Dimensionality Difficulties—Reprise	322
3. Polynomial Approximation	323
4. Orthogonal Polynomials	323
5. Gaussian Quadrature.	324
6. A Numerical Example	325
7. Use of Calculus	326
8. Stability	327
9. The Brachistochrone Problem	327
10. Mathematical Formulation	328
11. Variational Solution	329
12. Dynamic Programming Formulation	329
13. Computational Procedure.	330
14. Numerical Results	331
15. A Problem with Constraints	332
16. Analytic Solution	332
17. Dynamic Programming Formulation	332
18. Computational Procedure.	333
19. Numerical Results	334
20. Approximation by Piecewise Linear Functions	334
21. Basic Recurrence Relation	335
22. Extensions	335

CONTENTS

APPENDIX I:

ON A TRANSCENDENTAL CURVE, BY O. GROSS

SECTION

1. The Number of Inflection Points 337
2. A Necessary and Sufficient Condition for Convexity 338

APPENDIX II:

A NEW APPROACH TO THE DUALITY THEORY OF MATHEMATICAL PROGRAMMING, BY S. DREYFUS AND M. FREIMER

1. Introduction 340
2. The Dual Linear Programming Problem 340
3. The Kuhn-Tucker Equations: Quadratic Case 344
4. The Kuhn-Tucker Equations: General Case 346

APPENDIX III:

A COMPUTATIONAL TECHNIQUE BASED ON SUCCESSIVE APPROXIMATIONS IN POLICY SPACE, BY S. DREYFUS

1. Introduction 348
2. The Problem 348
3. The Recurrence Equations 349
4. The Means of Improvement 351

APPENDIX IV:

ON A NEW FUNCTIONAL TRANSFORM IN ANALYSIS: THE MAXIMUM TRANSFORM, BY R. BELLMAN AND W. KARUSH

1. Introduction 354
2. The Maximum Transform 355
3. Inverse Operator 355
4. Application 356

APPENDIX V:

THE RAND JOHNNIAC COMPUTER, BY S. DREYFUS
