Preface to the first edition — VII

Authors preface to the third edition — IX

Authors preface to the second edition — XV

Prologue — XVII

1 Introduction — 1

- 1.1 The human problem: a changing earth system — 1
- 1.2 Chemistry: a historic view — 5
 - 1.2.1 Definition of chemistry — 5
 - 1.2.2 Atmospheric chemistry: a terminological and historical approach — 8
 - 1.2.3 A brief history of chemistry — 15
 - 1.2.4 Terminology — 28
 - 1.2.4.1 On the chemical nomenclature and symbols — 28
 - 1.2.4.2 On the origin and meaning of the words air, fog, and smoke — 31

2 History of investigation and understanding the climate system — 41

- 2.1 Air and atmosphere before exploring air chemical composition — 44
 - 2.1.1 Ancient views: origin of the world — 44
 - 2.1.2 Ancient views: air and water — 46
 - 2.1.2.1 Greek philosophers — 46
 - 2.1.2.2 The time after *Aristotle* — 49
 - 2.1.3 The time after 1600 — 52
 - 2.1.3.1 Beginning measurements — 52
 - 2.1.3.2 Theories on condensation and evaporation — 54
 - 2.1.3.3 Alchemy: airs and gases — 66
- 2.2 Discovery of air chemical composition — 73
 - 2.2.1 A brief history of the discovery of gases — 73
 - 2.2.2 Carbon dioxide — 83
 - 2.2.3 Nitrogen — 84
 - 2.2.4 Oxygen — 86
 - 2.2.5 Water — 87
 - 2.2.6 Argon and the other novel gases — 91
 - 2.2.7 Air analysis — 92
 - 2.2.7.1 Determination the goodness of air: eudiometry — 92
 - 2.2.7.2 Analysis of oxygen — 95

2.2.7.3	Carbon dioxide measurements —	99
2.2.8	Trace gases —	107
2.2.8.1	Ozone —	116
2.2.8.2	Hydrogen peroxide —	128
2.3	Understanding interaction between biosphere and atmosphere —	137
2.3.1	A brief history of understanding plant growth and photosynthesis —	137
2.3.2	Cycling of matter —	142
2.4	Investigation of atmospheric waters in air —	149
2.4.1	Alchemist treatment of atmospheric waters —	154
2.4.2	Transmutation of rainwater into earth —	162
2.4.3	Colored rain and snow —	164
2.4.4	Rainwater studies before 1800 —	166
2.4.5	Rainwater studies 1813–1863: an analytical approach —	174
2.4.6	Rainwater analysis for understanding agricultural chemistry (1851–1950) —	183
2.4.6.1	Agriculture Experimental Stations —	183
2.4.6.2	The “nitrogen period” (1851–1919) —	187
2.4.7	Rainwater analysis for understanding air pollution and air chemistry —	207
2.4.7.1	<i>Robert Angus Smith</i> : air and rain (1869–1872) —	209
2.4.7.2	The “sulfur and chlorine period” (1870–1945) —	214
2.4.7.3	The “geochemical and meteorological period” (1945–1960) —	227
2.4.7.4	Precipitation chemistry after 1960: an outlook —	233
2.4.8	Fog and cloud water studies —	237
2.4.8.1	Fog water studies before 1900 —	239
2.4.8.2	Fog and cloud water studies: understanding condensation nuclei (1925–1955) —	241
2.4.8.3	Fog and cloud water studies: understanding air pollution (1955–1970) —	244
2.4.8.4	Fog and cloud water studies: understanding chemistry (1971–1990) —	245
2.4.8.5	Fog and cloud water studies after 1990: an outlook —	249
2.4.9	Dew water studies —	252
2.5	Investigation of dust (particulate matter) in air —	257
2.5.1	A short history of understanding particulate matter in air —	258
2.5.2	Soil dust: <i>Ehrenberg’s</i> red dust —	265
2.5.3	Dry fog —	268
2.5.4	A brief history of town pollution —	269
2.5.5	Smoke and fog: smog and the soot plague —	273
2.5.6	On sea salt as cloud condensation nuclei —	278

2.6	Climate and climatology: a historic perspective —	280
2.6.1	Understanding climate —	280
2.6.2	Understanding climate change —	288
3	History of the climate system: the chemical evolution —	293
3.1	The prebiological period —	293
3.1.1	Origin of elements, molecules, and the Earth —	293
3.1.2	Origin of organic bonded carbon —	304
3.1.3	Origin of nitrogen —	311
3.2	Evolution of the atmosphere —	314
3.2.1	Degassing of the Earth: the formation of the atmosphere —	315
3.2.1.1	Volcanic gases —	315
3.2.1.2	Occluded and produced gases from rocks —	318
3.2.1.3	The prebiological primitive atmosphere —	323
3.2.2	Biosphere–atmosphere interaction —	329
3.2.2.1	Origin of life —	329
3.2.2.2	The rise of oxygen and ozone: biogeochemical evolution —	335
3.2.2.3	The carbon and oxygen pools and global cycling —	342
3.2.2.4	Life limits by catastrophic events: mass extinction —	350
3.2.2.5	Biosphere and the noosphere —	352
3.2.2.6	What is the role of life in earth climate system? —	357
3.2.3	Abiogenic versus biogenic formation of “fossil fuels” —	361
3.3	Climate and climatology: change —	362
3.3.1	Climate change in past: paleoclimatology —	363
3.3.2	Climate change and variability —	364
4	A changing climate system —	373
4.1	The Earth’s energy sources —	374
4.1.1	Geothermal energy —	374
4.1.2	Wind energy —	376
4.1.3	Water energy —	378
4.1.4	Biomass and energy —	379
4.1.5	Solar energy —	380
4.1.6	Comparison among Earth’s energy sources – potential for humans —	381
4.2	Humans historic perspective —	384
4.2.1	From the past into future —	384
4.2.2	Energy: fossil fuel use —	390
4.2.3	Agriculture: the food problem —	401
4.2.4	Land-use change: the population problem —	404
4.2.4.1	Deforestation —	404
4.2.4.2	Biomass burning —	407

4.2.5	Eastern German air pollution abatement: a world-wide unique example — 413
4.2.5.1	Change of emissions — 416
4.2.5.2	Change of concentrations in the gas phase — 422
4.2.5.3	Change of concentrations in cloud water at Mt. Brocken — 437
4.2.5.4	Change of concentrations in rainwater at Seehausen — 454
4.2.5.5	Emissions versus concentrations: chemical climatology (summary) — 466
4.3	Emission of atmospheric substances — 473
4.3.1	Introduction: estimation of emissions — 474
4.3.2	Sulfur dioxide (SO ₂) — 479
4.3.3	Nitrogen oxides (NO _x) — 483
4.3.4	Carbon dioxide (CO ₂) — 484
4.3.5	Ammonia (NH ₃) — 488
4.3.6	Methane (CH ₄) — 491
4.3.7	Dinitrogen monoxide (N ₂ O) — 494
4.3.8	Carbon monoxide (CO) — 496
4.3.9	Non-methane volatile organic compounds (NMVOC) — 498
4.3.9.1	Isoprene and monoterpenes — 500
4.3.9.2	Oxygenated volatile organic compounds (OVOC) — 502
4.3.10	Reduced sulfur compounds (H ₂ S, DMS, COS, CS ₂) — 504
4.4	Atmospheric substances: concentrations and trends — 507
4.4.1	Fundamentals: why concentration fluctuates? — 510
4.4.2	SO ₂ , NO ₂ and dust: classic for local to regional up-scaling — 512
4.4.3	CO ₂ : the fossil fuel era challenge — 514
4.4.3.1	The preindustrial CO ₂ level derived from ice core data — 514
4.4.3.2	The twenties century CO ₂ increase — 518
4.4.3.3	Timely and latitudinal CO ₂ variations — 521
4.4.3.4	The city dome CO ₂ — 523
4.4.4	CH ₄ and N ₂ O: permanent agricultural associates — 524
4.4.4.1	Methane (CH ₄) — 524
4.4.4.2	Dinitrogen monoxide (N ₂ O) — 527
4.4.5	Halogenated organic compounds: sit out problem — 528
4.4.6	CO: the biomass burning problem — 530
4.4.7	O ₃ : locally believed to be solved but regional unsolved — 533
4.4.7.1	Ozone trends in troposphere and stratosphere — 533
4.4.7.2	Ozone change with altitude — 540
4.4.7.3	Ozone timely variations — 541
4.4.7.4	Ozone budget: sources versus sinks — 543
4.4.8	H ₂ O ₂ : mysterious — 544
4.4.9	OH: the key oxidant — 548
4.4.10	H ₂ : light but problematic — 551

4.4.11	HNO ₂ : volatile acid and OH precursor —	552
4.4.12	HCl and HNO ₃ versus chloride and nitrate —	560
4.4.13	Particulate matter (dust) —	563
4.5	Atmospheric substances: impacts on health —	567
4.5.1	The basics —	570
4.5.2	The problem —	576
4.5.3	Nitrogen dioxide (NO ₂) —	579
4.5.4	Particulate matter (dust) —	585
5	Climate change mitigation: global sustainable chemistry —	591
5.1	Growth and steady-state economy —	593
5.2	The carbon problem: out of balance —	596
5.2.1	The carbon budget —	597
5.2.2	Atmospheric CO ₂ residence time —	602
5.2.3	Direct air capture (DAC) —	605
5.3	The energy problem: the last industrial revolution —	608
5.3.1	The carbon economy: CO ₂ cycling —	609
5.3.2	Solar fuels: carbon as a material and energy carrier —	615
6	Final remarks —	621
Appendix I List of acronyms and abbreviations found in literature — 627		
Appendix II Quantities, units and some useful numerical values — 631		
Appendix III Earth geological time scale — 635		
References — 637		
Name Index — 747		
Subject Index — 757		
Errata to Volume 1 — 773
