Acknowledgment

The scope and selection of topics addressed in the final form of this book were crucially inspired by mentors with their guidance and by giving me the freedom to find my own approach to answering questions and solving problems. Similarly, I would also like to thank colleagues, whose paths crossed at some point my academic journey, for supporting and motivating my line of thoughts and interests with invitations for extended research stays. In this context, I would like to thank Michael Struwe and Hans Christian Öttinger (both ETH Zürich), Andreas Prohl and Christian Lubich (both U. Tübingen), Martin Z. Bazant (MIT), Jan Haskovec (KAUST), Yongcheng Zhou (Colorado State U.), Peter Berg (U. of Alberta and Brock University), Daniel Peterseim (U. Augsburg), Ricardo Nochetto (U. of Maryland), Serafim Kalliadasis and Grigorios A. Pavliotis (both Imperial College, London), Bo Li (U. of California), Oliver Penrose (Heriot-Watt U.), Jacques Vanneste (U. of Edinburgh), Giles Richardson and Tiina Roose (both U. of Southampton), Grégoire Allaire (É. Polytechnique), Oliver Jensen (U. of Manchester), Andreas Herz (Ludwig-Maximilians-U. München), Peter Berg (U. of Alberta & Brock U.), Volker John and Jürgen Fuhrmann (both WIAS).

My research on the systematic and rigorous derivation of effective formulations in electrochemistry were only possible thanks to the grants awarded by the Swiss National Science Foundation (SNSF)[1] and by the Engineering and Physical Sciences Research Council (EPSRC), UK,[2] for supporting the build-up of my own research group. The understanding developed during these research projects represent a crucial part of this book, which never would have been possible without this kind of support.

I am also grateful for receiving a PECRE award (Grant PECRE-F13ERP01-0-0) funding six weeks of research at ETH Zürich and to the host Christoph Schwab. Thanks to discussions in this context on finite element tensor product approximations, I got the inspiration to develop the computational quantum algorithms for the numerical approximation of the linear systems of multiscale equations developed in this book.

The Heriot-Watt University and the Maxwell Institute for Mathematical Sciences allowed me to experience and mature on all possible aspects of everyday scientific research. Hence, I am grateful for the stimulating environment nurturing valuable impressions and experiences.

I would like to thank the members of the board of the Maxwell Institute Graduate School in Analysis and its Applications (MIGSAA)[3] and also the students who attended and actively participated in my homogenization courses during fall 2016 and spring 2017.

These courses have been extended and integrated into this book in the sections on modeling multiscale systems and their rigorous upscaling.

I want to express my gratitude to my current employer, the Swiss Government, for the highly interdisciplinary work on a real-time *Complex Heterogeneous System*, which represents a System with links to many related Sensor and Data Fusion Systems. The broad range of science and engineering topics involved in the daily work have extended my scientific horizon and hence also greatly influenced the direction and scope of this book over the last four years.

Finally, I am very grateful to Erich Carelli (Eastern Switzerland University of Applied Sciences) for the careful and time-consuming proofreading of this book, leading to many helpful comments valuably improving the readability and quality of this text.
