Preface — V

1 Introduction — 1

2 Basics — 5

- 2.1 Notation — 5
- 2.2 Volume average — 7
- 2.3 Voigt–Mandel notation — 7
- 2.4 Projectors — 8
- 2.5 Hooke’s law — 10
- 2.6 The isotropic Hookean law — 11
- 2.7 Generalization of real functions to tensors — 11
- 2.8 List of symbols — 12

3 Characterization of microstructure — 13

- 3.1 Indicator function — 13
- 3.2 One point statistic — 13
- 3.3 Multipoint statistics — 14
- 3.4 Periodic microstructures — 19
- 3.5 Other statistical descriptors — 19
- 3.6 Generating material distributions for given correlation functions — 20
- 3.7 Summary — 21

4 The initial and boundary value problem of homogenization — 23

- 4.1 The differential equation — 25
- 4.2 Scale separation — 26
- 4.3 Integral theorems of homogenization — 28
 - 4.3.1 Effective strains — 29
 - 4.3.2 Effective stresses — 29
 - 4.3.3 The Hill–Mandel condition — 31
 - 4.3.4 Change of the independent variable in case of homogeneous stress boundary conditions — 33
 - 4.3.5 Generalized boundary conditions that satisfy the Hill–Mandel condition — 34
- 4.4 Numerical homogenization — 36

5 Homogenization with the aid of structural mechanics — 39

- 5.1 Small strains: a simple model for honeycombs — 39
- 5.2 Large strains: a nonlinear truss model — 44

6	Estimates in terms of volume fractions — 51
6.1	Voigt–Reuss bounds — 51
6.1.1	Interpretation of the Voigt–Reuss averages — 52
6.1.2	Bounding properties of the Voigt and Reuss means — 53
6.2	Averages between the Voigt–Reuss bounds — 55
7	Basic solutions — 59
7.1	The laminate solution for linear elastic materials — 59
7.1.1	Jump conditions at the interface — 59
7.1.2	Mixture rule — 60
7.1.3	Material laws — 61
7.1.4	The effective laminate stiffness — 61
7.1.5	Concentration tensors — 64
7.1.6	The laminate solution with eigenstrains — 65
7.1.7	Remarks regarding the laminate solution — 66
8	Reformulations of the homogenization problem: The eigenstrain problem, the polarization problem and influence tensors — 67
8.1	Difference problem — 67
8.2	Homogeneous eigenstrain problem — 68
8.3	Polarization problem — 68
8.4	Influence tensors, concentration tensors, polarization tensors and localization tensors — 69
9	Improved estimates based on the Eshelby solution — 71
9.1	Eshelby solution — 71
9.2	Eshelby’s concentration tensor — 71
9.3	Dilute distributions — 72
9.4	Mori–Tanaka — 74
9.5	Differential scheme — 75
9.6	Self-consistent method — 78
10	Percolation bounds — 81
10.1	Discrete percolation models — 81
10.2	Continuous percolation models — 82
10.3	Relation between percolation and effective properties — 83
11	Hashin–Shtrikman variational method — 85
11.1	The solution — 86
11.2	The functional’s value at the solution — 88
11.3	Maximum or minimum — 89
11.3.1	Maximum condition — 89

11.3.2	Minimum condition —	89
11.4	Derivation of bounds —	90
11.5	Hashin–Shtrikman bounds —	91
11.6	The Hashin–Shtrikman bounds for heat conduction and diffusion —	95
11.7	Comments regarding the Hashin–Shtrikman bounds —	97
12	Fourier and Green methods —	99
12.1	Fourier series of real functions —	99
12.2	Fourier series in $\mathbb{R}_3$ —	101
12.3	From Fourier series to Fourier transforms —	102
12.4	Properties of the Fourier coefficients —	104
12.4.1	Homogeneous part —	104
12.4.2	Symmetries in Fourier space reflect statistical properties of the microstructure —	104
12.5	Hashin–Shtrikman interaction tensor —	105
12.5.1	Linear elasticity —	105
12.5.2	Heat conduction and diffusion —	110
12.6	Decomposition of periodic fields into three orthogonal parts —	112
12.6.1	Determination of the effective properties —	115
12.6.2	Example: Laminate —	117
12.6.3	Discrete microstructures —	122
12.6.4	A linear solver for an individual component —	125
12.7	Spectral solver: Fixed-point iteration for RVE problems —	126
12.7.1	Fixed-point iteration for solving a differential equation: A 1D example —	127
12.7.2	Fixed-point iteration involving Fourier transforms —	130
12.8	Green’s function method —	135
12.8.1	Green’s function method example for the Laplace operator —	136
12.8.2	The fixed-point iteration in real space as integral equation —	138
13	Orientation averages —	141
13.1	Orientations and rotations —	141
13.1.1	Axis-angle parameterization —	145
13.1.2	Euler angle parameterization —	147
13.1.3	Rodrigues parameterization —	148
13.2	Rotations of tensors of arbitrary order —	150
13.3	Hooke’s anisotropic law —	151
13.4	From volume averages to orientation averages —	155
13.4.1	Discrete orientation distributions —	158
13.4.2	Continuous orientation distributions —	158
13.5	Integration over $SO(3)$ —	159
13.6	Graphical representation of orientation distributions —	164

13.7	Generation of discrete isotropic distributions in $SO(3)$ —	165
13.7.1	Isotropic orientation distributions for arbitrary dimensions —	168
13.7.2	Orientation mean value —	169
13.8	Integration over isotropic distributions in $SO(3)$ —	169
13.9	Application of the orientation average —	172
13.9.1	The heat conductivity of black phosphor —	172
13.9.2	Young's modulus of steel —	173
13.9.3	Isotropic orientation average and the Hashin–Shtrikman bounds —	178

Bibliography — 183

Index — 187
