Preface

Most books on modern logic, whether textbooks or otherwise, fall into one of two classes. The first is that large group of texts aimed exclusively at readers whose main interest lie in the foundations of mathematics, and who maintain that all other problems concerning logics and their uses are derivative, and should be treated, if at all, as secondary. The other class contains elementary textbooks that are obviously written for persons who have not yet acquired even the beginnings of philosophical, historical or scientific sophistication, or who are at least willing to forget about it for the period of their instruction in logic.

It seemed to us that yet a third approach to the relationship between logic, philosophy and our culture at large is possible and valuable, and in fact that a new attitude is long overdue. The present book is therefore written specifically with the following audience in mind: philosophers and students of general philosophy, as well as scholars and students in neighboring fields such as linguistics, physics, communication, political science, law, sociology, economics, cognitive psychology, theology, and the humanities. We hope that it will in some measure satisfy the basic needs for information about and instruction in logic, as felt by persons from these fields of contemplation and research, and that it will show or suggest to them something of the relationship between logic and their own academic or practical pursuits.

The book is not really meant for students of mathematics, although we hope that some of them, too, will be interested in parts of it. They have their own books, containing considerable material that we do not even mention in passing here. On the other hand, we believe that it would be a mistake to try to avoid “mathematical” symbolism entirely, especially as this may help to eliminate misinterpretations (admittedly after an initial period of learner’s confusion). Nor should one abstain from using mathematical methods, wherever there are potential readers — those who are mathematically trained — who will demand such a treatment before they are able to agree that our conclusions are sound. It is not, however, merely to obtain this agreement, important though it is, nor is it merely to conform to academic fashion, that we have made some use of mathematical methods. We consider that everyone, from engineers to theologians (not necessarily very different people, by the way), should be shown with what care modern logical theories are formulated and evaluated. The metalogical problem of the “completeness” (relative to something else) of a logic system is therefore discussed throughout. Philosophical readers, on the other hand, should be taught this without being led to assume that mathematics is in all respects metaphysically fundamental and verbal intercourse in all respects derivative. We have tried consistently to treat the verb “to prove” as, basically, a ternary relative verb: someone proves (or fails to prove) something *to someone*. To drop consistently the words “to someone”, even in basic uses of the verb

“to prove” — and this is still a habit among logicians — is to enshroud the topic in mystery and invite accusations of “elitism” or “authoritarianism” which can in fact be avoided.

A second aim of our book is to contribute to the development of a theory of rational and critical argumentation by offering a complete formulation of *Lorenzen’s dialogue method* in “formal” logic, with forays into “material” logic in the form of material dialogues; this we hope to have brought within the reach of non-mathematicians.

Third, we intend to show — for propositional logics — the *equivalence of the various contemporary approaches to elementary formal logic*: the dialogue method and dialogical tableaux, axiomatic derivations, natural deductions and deductive tableaux, model theory and semantic tableaux. This is an extension of the programme of: E. W. Beth, *Formal Methods* (1962), where the dialogue method is missing (for chronological reasons), and where natural deduction is not well distinguished from the method of deductive tableaux. In *Formal Methods*, Beth spoke of the unity of the *three* methods. His book, moreover, was hastily written and as a result it has never been much read, despite its contents, which were eminently suited (at that time, 1962) to the purpose of explaining logic, and what logic is, to the general philosopher. We believe that no text is available in any language that incorporates all these approaches and demonstrates their “unity”. This degree of comprehensiveness explains the length of our book.

We shall show this (i.e., the equivalence of several different approaches) for three logics, namely “classical” (two-valued) logic, constructive (or, intuitionistic) logic and minimal logic; and this we shall do for *three different language forms*, viz. for purely implicational languages and for languages with, as well as for languages without, a “rigid” sentential descriptor for falsity or absurdity.

Our aims are not only didactic in the narrower sense. We should like to think that the following features of the book have a certain originality:

- Sections on the philosophy of logic and on the historical development of the general outlook on what logic is all about (Chapters I, II, XII, and interwoven with other topics at numerous places);
- A normative foundation for Lorenzen’s dialogue method, and thereby for elementary logics in any style, presented in a way suited to the goal of establishing a social contract about verbal behavior (Chapter III);
- A conceptual basis in, among other things, the notion of a *conflict of avowed opinions*, bringing to the fore the thesis that logical (dialectical) activity has *conflict resolution* as its intrinsic goal;
- Dialectical rules for minimal logic, with and without rigid sentential descriptors for falsity (Chapter IV);
- Particularly simple algorithms for transformation of (closed) dialogical strategy tableaux into (closed) deductive tableaux, which are clearly distinguished from the former; and also for the transformation of (closed) deductive tableaux into natural deductions (Chapter VII); also for the transformation of (closed) classical, constructive and minimal semantic tableaux into winning strategies (Chapter XI);

- Discussion of the ways in which material (e.g., ostensive) methods and moves can be incorporated into dialectic systems (Chapter IV);
- Reinterpretation of Kripke's constructive and of Kripke-styled minimal epistemic models of growth of knowledge into *dialectical models of growth of agreement*; in other words, *the models* for the various dialectic systems – classical, constructive, minimal – *are taken from the field of argumentational activity itself* (Chapter IX);
- Completeness/Soundness proofs for the dialogical tableau method in formal logic *via* the deductive and semantic tableau methods, together with dialectical models. Thereby we have circumvented Gentzen's cut-elimination theorem and its analogues, which are conceptually inaccessible to the majority of general philosophers.

More important still, these new philosophical models are of immediate interest in themselves, offering a new perspective for logic and general philosophy. The budding Theory of Argumentation may, given these models, be regarded as a self-contained field and a self-contained philosophical programme, i.e., as a philosophical and a practical pursuit which is independent of remnants of classical, "ontology"-based, epistemology. *Social (dialectical) models are offered corresponding to dialectic systems* (as shown in Chapter XI).

Perspectives such as these are sketched briefly in Chapter XII, where we discuss the possibility that "ontology", even in its analytic form, was constructed as an ("the") absolute theoretical state – a notion without which processes of growth of agreement could not formerly be conceived, and without which structures of models for such processes could not be formulated. Two-valuedness belongs with ontology construed as "the" final or absolute state.

In order to present all this material to as many philosophers as possible, and in a single volume, *we have refrained from a discussion of the treatment of quantifiers or of modal operators*. The book contains examples and exercises, and is also intended for use as a textbook. It has become almost standard behavior to announce in logic texts that "no previous knowledge of logic is required"; and there have been some bold attempts at teaching the theories of Gödel within the first academic year. We do not join this chorus. An extensive introductory course is, for practically everybody, a prerequisite for the second and third parts, but not for the first part (and perhaps not for Chapter XII), which can be read – and in large measure understood – by anyone with some philosophical experience. In our courses for philosophy students (which of course also contained other material) we have found that material such as that in Part One can be profitably treated in the second year of the curriculum (at university level), and the second and third parts in the third year. Courses based on this book can be envisaged which do not follow the order of presentation of topics that we have chosen here. Thus a course may very well start with natural deduction (Chapter VI), or with dialectical models (Chapter IX).

The cultural and practical importance of logic (logics) is often mentioned but rarely demonstrated. It is usual to find the whole subject, including its history, treated in isolation from practically all philosophy, to say nothing of (other) public affairs. We wanted to write a text which would meet a number of culturally hot philosophical topics head-on. (What are we to understand by dialectic-

tics? Are formal logics reactionary?, and so on.) This may sound pretentious, but someone has to break the ice surrounding modern logic, and to run the risks that this implies.

We have been much stimulated by the response of our students in Utrecht and, later, in Groningen. We are grateful to them as well as to many others – to colleagues and students in the social sciences, for example – for encouragement and tokens of interest in the connections and perspectives discussed here. We received helpful criticism or other valuable comment from F. H. van Eemeren, R. Grootendorst, J. A. Hoeben, M. Henket, T. Kruiger, K. Lorenz, J. D. North, V. Sánchez Valencia, F. H. H. Schaeffer, E. Thijssen, F. J. M. M. Veltman and R. de Vrijer. Their comments led to a number of improvements in the text.

Warm thanks are due to those who undertook the arduous task of typing our manuscript. Large parts of the text were meticulously handled by F. A. Mulder at the Centrale Interfaculteit, Utrecht, and by C. A. M. Roy. F. C. van der Louw and P. M. Vooijs-Treffers did their utmost to help complete the typing as we became pressed for time. We wish to thank C. A. M. Roy and P. van Ulsen for their assistance in proofreading. The book would not have contained any indexes but for the efforts of P. van Ulsen.

Our especial gratitude is to C. A. M. Roy, of the University of St. Andrews, who also improved our English. Being a trained psycho-linguist she understood what she read, offered enlightened comments on grammar, idiom and style, and with the greatest of tact even pointed out inconsistencies in our presentation.

There are others whom we do not mention by name but to whom we are grateful for their constant support.

Groningen and Utrecht

An Analytic Table of Contents
in which are listed
definitions, rules, lemmas, theorems and important terms

Preface	VII
A List of Variables	XXXVII

PART ONE: LOGICS AND DIALECTICS 1

Chapter I. The philosophical situation 3

I.1. From axiomatic system to a contract about rules for
critical dialogues. A survey of the forms of logical theory
since the turn of the century 3

three “laws of thought” of traditional logic 3

The Theoretical Cube (Figure I.1.) 4

(i) syntactical dimension; logical constants,
lexicon 3–5

(ii) dimension of logical strength; classical
logic, constructive (intuitionistic) logic;
minimal logic 5–7

(iii) dimension of modes of presentation, or
“garbs”; axiomatic garb; inferential
garb; model-theoretic garb; dialectical
garb 7–13

1. The algebraic approach; 2. Axio-
matics; 3. Model theory; 4. Natural
deduction; 5. Sequent systems;
6. Method of semantic tableaux,
counter-example, valuation problem,
reduction rules; 7. Method of deduc-
tive tableaux, deduction problem;
8. Dialogue games; 9. Method of dia-
logical tableaux. 8–13

I.2. The unity of the garbs and methods in modern logic . . . 13

I.3.	On the different uses of “formal” and “deductive” and on the different views about the grounds of validity . . .	14
(i)	form ₁ , formal ₁	14–15
(ii)	form ₂ , formal ₂ ; formally, deductively valid, formal consequence; <i>bona consequentia</i> , deduction in “logical space” (formal ₁), <i>suppositio naturalis (potentialis)</i> ; formal ₂ deduction	15–19
(iii)	form ₃ , formal ₃ , formal ₃ procedure . . .	19
I.4.	Problem-solving and social contract: ten theses on the philosophy of logic	19
	principal objective of theoretical logic	19–20
	Aristotle’s Principle of the Absolute; ‘the logic’, notion of —	20
	language system or principle (σ); σ_1 should be preferred to σ_2	20
	logico-intellectual language-problem (π); σ is adequate in respect of π ; σ_1 is objectively better than σ_2 ; σ is objectively valid; problem-solving validity .	20–21
	<i>Moralprinzip</i> ; logical convention; social contract; company (γ); σ is a conventional principle of γ ; σ is logically valid; intersubjective/conventional validity; logical semi-conventional validity	21–22
I.5.	From <i>Cogito</i> to <i>Dubito</i>	22
I.6.	Remarks on conflicts, aggression, and critical discussions	25
(i)	conflicts of opinion	25
(ii)	<i>status quo</i> ; flux of opinions; power systems; critical debate	25–26
I.7.	Glimpses from traditional philosophy	26
(i)	debate; topics; probable dialectics; rhetoric	26
(ii)	<i>ars disserendi</i> ; <i>Vernunftlehre</i> ; <i>Wissenschaft der Logik</i> ; <i>dialectica</i>	26–27
(iii)	external Secondness; <i>das Du</i> ; associative thought	27

(iv)	pessimism; optimism; Great Chain of Being; Principle of Plenitude	27–28
(v)	<i>Widerstreit</i> , <i>Gegner</i> ; pre-predicative . . .	28
(vi)	deductive and inductive thought; <i>dictum de omni et nullo</i> ; killing and incarceration	28–30
(vii)	idea; idealists; idea-ists; interior monologue	30
(viii)	<i>Sinn</i> (unclear meaning of —); heyday of ideas, — of public meanings, — of sentences, — of sequents	30–31
(ix)	arena for discussions about research into foundations	31–32
(x)	conflict of avowed opinion	32
(xi)	externalization, — of space, — of demonstration, — of conflict	32–33
(xii)	. . . any opponent . . . ; no error . . .	33–34
(xiii)	opposition; asymmetry; asymmetric polyadic predicates; electrical conflicts; to be incompatible; critical discussion	34–35
(xiv)	social conflict, — of avowed opinion .	35
(xv)	<i>fundamentum in re</i> ; <i>fundamentum</i> in human disagreement	35–36

Chapter II	Declarative languages, dialectical languages, and speech acts	37
	the importance of syntax for logic	37
II.1.	Some methodological considerations concerning the study of language forms	37
	formal ₂ language, artificial —, natural —; represent, representation	37–39
	formal science, empirical —; empirical intuition	39
	<i>characteristica universalis</i> ; <i>calculus ratiocinator</i> ; ideal language	41

II.2.	Declarative (descriptive) languages of the form \mathcal{J}	41
	the language \mathcal{J}_1 ; elementary/atomic sentence (atom), connective, sentence, grammatical (formation) rules, syntax, construction diagram, principal operator; conditional (sentence), antecedent, consequent, purely implicational languages/languages of the form \mathcal{J} ; mode of construction, application of a — — —; (proper) subsentence, — formula; dummy sentence, the language \mathcal{J}_0 ; the arrow; generating specifications (inductive clauses), generating/inductive/recursive definitions, generated/inductive class	41–46
	<i>Convention 1</i> : object language, speaking about an — —, unspecified — —, $T-Z$, \rightarrow ; <i>Convention 2</i> : mentioning, double quotes; inscription (utterance), symbol, sequence of symbols; <i>Convention 3</i> : $T-Z$; occurrence; <i>Convention 4</i> : mixed sequence of symbols	46–48
II.3.	Declarative (descriptive) languages of the forms \mathcal{T} and \mathcal{T}^Λ	48
	languages of the form \mathcal{T} ; negations, conjunctions, veljunctions; the language \mathcal{T}_0 , the ampersand, the vee, the tilde; languages of the form \mathcal{T}^Λ , Λ (absurd/decidedly false sentence or veljunction of sentences)	48–50
II.4.	Dialectical languages and language forms	50
	non-descriptive/non-declarative/dialectical sentence forms, challenging/hypothetical — —, interrogative — —, exclamatory — —	50–51
	dialectically augmented language forms \mathcal{J}_D , \mathcal{T}_D , \mathcal{T}_D^Λ	51
	dialectical language/D-language \mathcal{L}_D , \mathcal{L}_D^Λ	51
	declarative sentence assertive —, hypothetical —, question, exclamation; statement, assertive —, hypothetical —	51
II.5.	Speech acts	52
	list of schools and theories, with most prominent speech acts; theory of argumentation, verbal dialectics, verbalized “double focus”, interaction of speech acts	52
	Exercises	52

Chapter III	Conflicts of opinion and methods for their resolution	54
	dialectically valid; <i>dialectica</i> , Obligation Game, <i>dialogisch-definit</i> ; language-invariant rules	54–55
III.1.	Conflicts of avowed opinions	56
	Def. 1 <i>conflict of avowed opinions, thesis, concessions, pure/simple conflict, mixed</i> –	56
	difference of avowed opinion, opposition of opinion (belief)	56–57
III.2.	Deciding to discuss. Dialogue attitudes	57
	Def. 2 <i>resolved</i>	57
	propositional attitudes, statemental dialogue attitudes	57–58
	Def. 3 <i>pro-position</i>	58
	Def. 4 <i>contra-position</i>	58
	Def. 5 <i>neutral position</i>	58
III.3.	Proponent and Opponent	58
	dialectical roles	58–59
	Def. 6 <i>Proponent</i>	58
	Def. 7 <i>Opponent</i>	58
III.4.	Speech acts	59
	Speaker, Critical Listener (Critic), <i>aU</i>	59
	Def. 8 <i>counter-attack/counter-criticism</i>	59
	counteractive/indirect defense, <i>ca</i> ; protective/ direct defense, <i>pU</i> ; The Principle of (verbal) Externalization of Dialectics, <i>ExtDial</i> ; <i>a_iU</i> , <i>p_{ij}U</i> , <i>ca</i> ; to criticize, to attack, to challenge	60–62
III.5.	The elementary rules of some plausible systems of formal dialectics	62
	FD E1 P and O	62
	FD E2 general attitudes of P and O	62
	FD E3 defense act: protective or counter-active	62

	FD E4	= <i>ExtDial</i>	62
	FD E5	non-permitted moves	63
	FD E5 super	non-permitted moves	63
III.6.	Systematic dialectics		63
	FD S1	(fundamental norm) defense by making another statement	63
	Def. 9	<i>stage</i>	63
	Def. 10	(appropriate) <i>chain of arguments</i>	63
	Def. 11	(appropriate) <i>discussion</i>	64
	Def. 12	<i>intermediary thesis; local thesis</i>	64
	Def. 13	<i>local concessions</i>	64
	Def. 14	<i>local conflict</i>	65
	Def. 15	<i>local discussion</i>	65
	Def. 16	<i>pertains to</i>	65
	FD S2	conditional defense by means of a new local thesis	65
	Exercise		67
III.7.	Realistic dialectics: The possibility of unconditional defense		68
	FD R1	(fundamental norm) sometimes an attempt by P shall be successful	68
	Def. 17	<i>appropriate Ipse dixisti!-remark</i>	68
	FD R2	unconditional defense by <i>Ipse dixisti!</i> .	69
	FD R3	loss of rights	70
	Exercise		70
III.8.	Winning and losing: Definitions and immediate effects .		71
	FD W1	winning a chain of arguments by rational means	71
	FD W2	losing a chain of arguments by rational means	71
	FD W3	“irrational”	71
	Def. 18	<i>completed</i> chain of arguments	72

	FD W4	a. successful defense; b. successful refutation	72
	FD W5	expression, by N, of \bar{N} having won . . .	72
	FD W6	expression, by N, of \bar{N} having lost . . .	72
	FD W7	reopening of discussions	72
	Exercise		72
III.9.	Connection between expression of statemental dialogue attitudes and loss of rights		73
	Def. 19	<i>contrary</i> dialogue attitudes	73
	Exercise		74
III.10.	Rights and obligations		74
	[ca; p _{il} U, . . . , p _{ij} U, . . . , p _{ik} U]		74
III.11.	Mixed conflicts		74
	complex/mixed conflicts, interference among simple/pure conflicts; fundamental asymmetry in simple conflicts		74–75
III.12.	“Natural” rules; “Consequences”		75
	(i)	The “naturalness” of the rules suggested here	75
		logic, theory of argumentation, higher-order rules	75–76
	(ii)	A note on the meaning of “consequence” in this book	76
III.13.	Thoroughgoing dialectics		76
	FD T1	(fundamental norm) opportunity to attempt attacks/defenses in all possible manners	76
	line of attack/defense		76
	FD T2	retracing one’s steps	76
	FD T3	losing a chain of arguments on account of retracing one’s steps	76
	Exercise		77

III.14.	Orderly dialectics	77
	FD O1 (fundamental norm) rights and duties determinate	77
	FD O2 a. loss of contra-position; b. loss of right to defend	77
	FD O3 retention of dialogue attitudes and obligations	78
	FD O4 isolation of local discussion	78
	FD O5 a. assuming neutral position; b. can- celling of obligations	78
	Exercises	79
III.15.	Dynamic dialectics	79
	FD D1 (fundamental norm) flux of opinions . .	79
	FD D2 unavoidable decisions to be reached as soon as possible	79
	FD D3 limiting branching off	80
	FD D4 dynamic chain of arguments	80
	FD D5 one utterance at each stage	80–81
	FD D6 limitation of counter-attacks	81
	FD D7 O must attack at once or not at all . . .	82
	Def. 20 a. <i>dialogue situation</i> ; b. <i>dialectically</i> <i>equal</i>	83
	Def. 21 <i>winning strategy</i>	83
	FD D8 no useless repetition of local thesis . . .	85
	Exercises	86
III.16.	Dynamic dialectics (II)	86
	FD D9 clearly defined structural operators . . .	86
	FD D10 decomposition	86
	F ₂ D 1 strip rules (“Lorenzen strips”): Rule _→ , Rule _~ , Rule _v , Rule _{At}	87–88
	Exercise	89

Chapter IV.	Variants of formal ₃ dialectics	90
	completion of systems of formal ₃ dialectics; fallacy (non-generated move)	90
IV.1.	Constructive dialectic systems	90
IV.1.1.	A dialectic system with constructive implication	90
	FD R2 \equiv (fundamental closure rule) . . . if and only if <i>Ipse dixisti!</i>	90
	Def. 1 CID (<i>constructive-IF dialectics</i>)	90
IV.1.2.	A dialectic system with constructive implication, con- junction, veljunction and negation	91
	Def. 2 CND (<i>constructive-NOT dialectics</i>) . . .	91
IV.1.3.	A dialectic system with constructive Λ	93
	Def. 3 <i>appropriate Absurdum dixisti!-remark</i> .	94
	FD R2 \equiv v . . . if and only if <i>Ipse dixisti!</i> or <i>Ab-</i> <i>surdum dixisti!</i>	94
	Def. 4 CAD (<i>constructive-Λ dialectics</i>)	94
	sequents, shorthand notation for $-$; discussion, chain of arguments <i>for</i> a sequent	95–96
	Exercises	96
IV.2.	Minimal dialectic systems	96
IV.2.1.	A dialectic system with minimal implication	96
	Def. 5 MID (= CID)	96
IV.2.2.	A dialectic system with minimal Λ : A stricture on the P-win-conditions	97
	Def. 6 MAD (<i>minimal-Λ dialectics</i>)	97
IV.2.3.	A dialectic system with minimal implication, conjunc- tion, veljunction and negation	97
	FD M-NOT a restriction on the permitted counter- attacks	97
	Def. 7 MND (<i>minimal-NOT dialectics</i>)	98
	Exercises	98
IV.3.	Classical dialectic systems	98
	FD K P retains its unused defense rights	98

IV.3.1.	A dialectic system with classical implication	100
Def. 8	KID (<i>classical-IF dialectics</i>)	100
IV.3.2.	A dialectic system with classical Λ	100
Def. 9	KAD (<i>classical-Λ dialectics</i>)	100
IV.3.3.	A dialectic system with classical implication, conjunction, veljunction and negation	101
Def. 10	KND (<i>classical-NOT dialectics</i>)	101
F ₂ D K	protective defense by double negation .	102
Exercises	102
IV.4.	Summary	102
	schematic survey (Figure IV.6)	103
Theorem 1	P has a winning strategy . . . in minimal (constructive) system \Rightarrow P has a winning strategy . . . in constructive (classical) system	103
IV.5.	Formal ₃ material dialectic systems	104
	material moves, formal ₂ moves; ostensive means, experimentation, consultation, computation; material truth procedure, material falsity procedure, to accept or reject implicitly/explicitly; the classes Π , Π_0 , \mathbb{F} , \mathbb{F}_0	104–105
IV.5.1.	Pure conflicts: Material procedures subjoined to our former dialectic systems	105
Def. 11	<i>appropriate Verum dixi!-remark</i>	105
Def. 12	<i>appropriate Falsum dixisti!-remark</i>	105
FD R2M	. . . if and only if <i>Ipse dixisti!</i> , or <i>Ab-surdum dixisti!</i> , or <i>Verum dixi!</i> , or <i>Falsum dixisti!</i>	105
FD DM1	P may demand application of the material truth procedure to atomic local thesis	106
FD DM2	P may demand application of the material falsity procedure to atomic concession	106

IV.5.2.	Mixed conflicts under complete opposition: A formal ₃ material dialectic system	109
Def. 13	<i>mixed conflict under complete opposition</i>	109
Def. 14	<i>White, Black</i> (roles)	109
Def. 15	revision of Def. 11, Def. 12	109
FD M1	revision of FD DM1	110
FD M2	revision of FD DM2	110
FD M3	revision of FD R2M	110
Def. 16	MatDial (<i>material dialectics for the resolution of mixed conflicts under complete opposition</i>)	110–111
Exercises	112
PART TWO: STRATEGIES AND DERIVATIONS		113
	earlier formal ₂ logic was regarded as “deductive”/“derivational”	115
Chapter V.	Winning strategies and dialogical strategy tableaux	117
	dialectical reconstruction of the notion of ‘logical validity’	117
V.1.	Dialogue sequents	117
Def. 1	<i>dialogue sequent</i>	118
	official system, P-liberalized system	119
Lemma 1	equivalence of official systems and P-liberalized systems	119
	shorthand notation for dialogue sequents; a_iZ , $[d_iZ]$	120–121
	types of sequents: P, OI, OII, OIII	121–122
Lemma 2	circulation of types	122
Def. 2	<i>material dialogue sequent</i>	123
Exercises	123

V.2.	Strategy diagrams	124
V.2.1.	Tree diagrams	124
	Def. 3 <i>tree; root; predecessor</i>	126
	node, finite/infinite tree, successor, final node, to dominate, path, branch	126
	Def. 4 <i>tree diagram</i>	126
	Def. 5 <i>N-strategy diagram</i>	126–127
	Def. 6 <i>N-winning strategy diagram</i>	127
V.2.2.	Rules for constructing P-winning strategy diagrams . . .	128
	compulsory rules, choice rules, closure rules; rules OI \rightarrow , etc., OII, OIII \rightarrow , etc., Pd, P \rightarrow , etc., Pid, Pad	128–130
V.2.3.	König's Lemma on trees	131
	Def. 7 <i>finitely branching</i>	131
	Lemma 3 König's Lemma	131
	Exercises	131
V.3.	Dialogical strategy tableaux	132
	dialogical tableaux, tree form notation, subtableaux, closed (sub)tableau	132–136
	Caveats 1–6	136
	schematic representation of rules	137–139
	Exercises	139
V.4.	Some simple properties of dialectic systems	139
	Lemma 4 local discussions are finite	139
	measure of the complexity of dialogue situations . . .	139
	Lemma 5 a chain of arguments in MatDial is finite	140
	Lemma 6 subformula property	141
	Lemma 7 each chain has finitely many local discussions	141
	Def. 8 <i>locally finite</i>	141
	Theorem 2 the official dialectic systems and MatDial are locally finite	141

	Lemma 8	winning strategy diagrams are finite . .	142
		induction on winning strategy diagrams, structural induction (induction on formulas)	142
	R_{At}	restriction of <i>Ipse dixisti!</i> to atomic statements	142
	Theorem 3	admissibility of R_{At}	142
	Exercises		145
V.5.	Equivalence of NOT-dialectics with Λ -dialectics		145
		equivalence of dialectic systems	145
	Theorem 4	equivalence NOT-dialectics/ Λ -dialec- tics	146
	Def. 9	<i>illicit application</i> of P^Λ ; <i>well-arranged</i> tableau	149
	Def. 10	Λ - <i>property</i>	149
	Def. 11	<i>essential occurrence</i> of Λ	150
	Lemma 10	no creation of essential occurrences of Λ	150
	Lemma 11	transformation into well-arranged tableaux (MAD)	150
	Exercises		153
Chapter VI.	Natural deduction		154
		introduction and elimination of hypotheses, system for natural deduction, int-elim-system, linear system	154–155
VI.1.	Minimal natural deduction rules		155
VI.1.1.	Minimal deduction rules for implication		156
	MP	<i>Modus Ponens Rule</i>	156
		dots, dashes, operative	156
	CP	<i>Rule of Conditional Proof</i>	157
		scope, scope indicator, subordinate deduction	157
	TRIV	<i>Trivial Deduction Rule</i> , iteration rule . .	157

Def. 1	MInd/CInd (<i>minimal/constructive-IF natural deduction</i>)	157
Def. 2	<i>deduction for a sequent according to a linear system of natural deduction</i>	158
VI.1.2.	Minimal deduction rules for conjunction, veljunction, negation and Λ	161
SEP ₁ , SEP ₂	<i>Separation Rules</i>	161
CONJ	<i>Conjunction Rule</i>	161
CD	<i>Rule of Case Distinction, Constructive Dilemma</i>	161
AD ₁ , AD ₂	<i>Addition Rules</i> , adjunction rules, veljunction rules	161
ECA	<i>Ex Contradictione Sequitur Λ</i>	162
RA	<i>Reductio ad Λ Rule</i>	162
Def. 3	M Λ nd (<i>minimal-Λ natural deduction</i>)	163
Λ_1, Λ_2		163
Theorem 5	variants of M Λ nd, etc.	163
VI.1.3.	Minimal deduction rules for negation that do not involve Λ	165
ECQN	<i>Ex Contradictione Sequitur Quaelibet Negatio</i>	165
MR	<i>Minimal Reduction Rule</i>	165
Def. 4	MNnd (<i>minimal-NOT natural deduction</i>)	166
Exercises		166
VI.2.	Constructive natural deduction rules	166
VI.2.1.	An additional constructive deduction rule for Λ	166
EAQ	<i>Ex Λ Sequitur Quodlibet</i>	166–167
Def. 5	C Λ nd (<i>constructive-Λ natural deduction</i>)	167
VI.2.2.	An additional constructive rule for negation that does not involve Λ	167
ECQ	<i>Ex Contradictione Sequitur Quodlibet</i>	167–168

Def. 6	CNnd (<i>constructive-NOT natural deduction</i>)	168
Exercises	168
VI.3.	Classical natural deduction rules	168
VI.3.1.	An additional classical deduction rule that involves implication only	169
P	<i>Peirce's Rule</i>	169
Def. 7	KInd (<i>classical-IF natural deduction</i>)	169
VI.3.2.	An additional classical deduction rule that involves \wedge	170
PA	<i>Peirce-\wedge-Rule</i>	170
Def. 8	KAnd (<i>classical-\wedge natural deduction</i>)	170
VI.3.3.	Additional classical rules that do not involve \wedge	170
KR	<i>Classical Reduction Rule</i>	170–171
Def. 9	KNnd (<i>classical-NOT natural deduction</i>)	171
EM	<i>Rule of Excluded Middle</i>	171–172
DN	<i>Double Negation Elimination Rule</i>	171–172
Theorem 6	variants of KNnd	172
Exercises	174
VI.4.	Purely hypothetical variants	174
VI.5.	Replacement of equivalents	176
REP	<i>Replacement of Equivalents</i>	176
Def. 10	a. <i>equivalent to . . . under (premises);</i> b. <i>interdeducible with</i>	177
Lemma 1	lemmas for replacement	177
Theorem 7	admissibility of REP	177–178
Exercises	179
Chapter VII.	Deductive tableaux	180
	keep the desired goal firmly in mind; reduce problem to simpler problems	180

VII.1.	Deductive tableaux with implication as the only logical constant	180
VII.1.1.	Deductive tableaux with minimal (and constructive) implication	180
	deduction problem (Π/Z), concludendum (Z), premises (Π); reduction rule, trivial deduction problem, left rule, right rule; $\rightarrow l$, $\rightarrow r$ (rules for the conditional); closed problem, c (<i>Closure Rule</i>) . .	180–182
Def. 1	a. <i>deductive tableau for a sequent, based on a system of reduction rules;</i> b. <i>closed</i> deductive tableau	182
Lemma 1	a closed deductive tableau is finite . . .	182
Def. 2	MI _{dt} or CI _{dt} (a system of rules for constructing deductive tableaux)	184
Lemma 2	“tape theorem” for MI _{dt}	185
VII.1.2.	Deductive tableaux with classical implication	189
Lemma 3	no closed tableau for some “classically valid” sequents	189
Def. 3	KI _{dt}	191
Lemma 4	“tape theorem” for KI _{dt}	192
Exercises	192
VII.2.	Transformation of dialogical tableaux into deductive tableaux	192
	unit, half a unit	193
Lemma 5	P-winning strategy (MID, KID) \Rightarrow closed deductive tableau (MI _{dt} , KI _{dt}) .	196
Exercises	198
VII.3.	The theory of deductive tableaux, for languages of the forms \mathcal{T} and \mathcal{T}^Λ	198
	& l_1 , & l_2 , & r (rules for conjunction), $\vee l$, $\vee r_1$, $\vee r_2$ (rules for veljunction), $\sim l_\Lambda$, $\sim r_\Lambda$, $\sim l_{\min}$, $\sim l$, $\sim r$ (rules for negation); other rules: Λc , $\rightarrow \Lambda K$, $\sim K$	198–202
Def. 4	MA _{dt} , MN _{dt} , CA _{dt} , CN _{dt} , KA _{dt} , KN _{dt}	202
Theorem 8	(the full “tape theorem”) closed deductive tableaux \Rightarrow natural deduction	203

Theorem 9	P-winning strategy \Rightarrow closed deductive tableau	203
Exercises		212
Chapter VIII.	Axiomatics	213
	connections with philosophy of mathematics, “philosophical” logics, meta-logic; comparison with metaphysical-logical deduction from (First) Principles/Origins	213–214
VIII.1.	Axiom systems with minimal (and constructive) implication	214
Def. 1	<i>axiom of minimal-IF axiomatics</i> (<i>Axs 1, Axs 2</i>)	214
	axiom schema, axiom, Rule of Substitution	214
Def. 2	M _I ax	215
Def. 3	a. <i>axiomatic deduction for a sequent according to an axiom system</i> ; b. <i>axiomatic proof</i> ; c. <i>thesis</i>	215–216
Lemma 1	the deduction theorem for minimal-IF logic	217
Exercises		220
VIII.2.	Other axiom systems	220
	<i>Axs &1, Axs &2, Axs &3</i> (axioms for conjunction); <i>Axs v1, Axs v2, Axs v3</i> (axioms for veljunction); <i>Axs ~min, Axs ~1, Axs ~2, Axs ~3</i> (axioms for negation); <i>Axs P, Axs Λ1, Axs Λ2, Axs Λ3, Axs Λ4</i> (axioms for Λ)	220–221
Def. 4	a. K _I ax; b. M Λ ax, C Λ ax, K Λ ax, MNax, CNax, KNax	221
Theorem 10	(the “ <i>deduction theorem</i> ”) natural deduction \Rightarrow axiomatic deduction	221
Exercises		227

PART THREE: DIALECTICAL MODELS 229

possibilities represented by models, model-theoretic
validity, counter-example; strategy problem, deduc-
tion problem, valuation problem 231

Chapter IX. Model-theoretic semantics 233

conceptual structure, interpretation, semantic rule,
model 233–234

IX.1. Classical models 234

(objectively) true, (objectively) false, truth value,
Truth, Falsity, type of sentence tag, \mathbf{T} , \mathbf{F} , \mathbf{T}_{ext} ,
 \mathbf{F}_{ext} , valuation 234–235

Def. 1 *classical model* 236

Def. 2 *classical valuation* (Sem_{At} , Sem_{\rightarrow} ,
 $\text{Sem}_{\&}$, Sem_{\vee} , Sem_{\sim} , Sem_{\wedge}) 236

Lemma 1 “rules for \mathbf{F} ” 236

Def. 3 a. *classical model for Π/Γ* ; b. *classical
counter-example to Π/Z* ; c. *classically
valid* (sequent) 237

Theorem 11 (*first soundness theorem*) the classical
axiomatic method is ontologically
sound 237

Exercises 239

IX.2. The adequacy of material dialectics 239

Def. 4 *N-favorable* 240

Lemma 2 *N-winning strategy for N-favorable
dialogue situations* 240

Theorem 12 (*adequacy theorem*) a. *W-winning
strategy for $Z \Leftrightarrow Z$ true*, b. *W-winning
strategy for Π/Z (generally) $\Leftrightarrow \Pi/Z$
classically valid* 242

Exercises 243

IX.3. Growth of agreement: Dialectical models for construc-
tive logic 243

	dialectical semantics, dialectical subject, positive agreement, Principle of Cumulation/Preservation of Agreement, (possible) dialectical situation (d), A (Agreement), N (Non-agreement), Agreed, Not-agreed, dialectical development relation (R), cumulative —, (non-) trivial cumulative development	243–245
Def. 5	<i>normal dialectical structure</i>	245
	Positively-Agreed-in-d, Not-Agreed-in-d	246
Def. 6	a. <i>interpretation</i> ; b. <i>cumulative</i> —	246
Def. 7	<i>constructive dialectical model</i>	246
	labeled graphs	247
Def. 8	<i>constructive valuation</i> ($Sem^c_{At}, Sem^c_{\&}, Sem^c_v, Sem^c_{\rightarrow}, Sem^c_{\sim}, Sem^c_{\Lambda}$)	248
Lemma 3	“rules for N ”	248
Lemma 4	cumulation of agreement	249
Def. 9	a. <i>constructive model for Π/Γ</i> ; b. <i>constructive counter-example to Π/Z</i> ; c. <i>constructively valid</i> (sequent)	249–250
Lemma 5	constructive validity of the rule MP	250
Theorem 13	(<i>second soundness theorem</i>) the constructive axiomatic method is dialectically sound	250
	Exercises	252
IX.4.	Absurdity and minimal dialectical models	252
	absurd dialectical situation, normal —	252
Def. 10	<i>minimal dialectical structure</i>	253
Def. 11	<i>cumulative interpretation</i> (on a minimal dialectical structure)	253
Def. 12	<i>minimal dialectical model</i>	253
Def. 13	<i>minimal valuation</i> ($Sem^m_{At}, Sem^m_{\rightarrow}, Sem^m_{\&}, Sem^m_v, Sem^m_{\sim}, Sem^m_{\Lambda}$)	253–254
Lemma 6	“rules for N ”	254
Lemma 7	cumulation of agreement	254

Def. 14	a. <i>minimal model for Π/Γ</i> ; b. <i>minimal counter-example to Π/Z</i> ; c. <i>minimally valid (sequent)</i>	255
Theorem 14	(<i>third soundness theorem</i>) the minimal axiomatic method is dialectically sound even when absurd situations are admitted	255
Theorem 15	classical (constructive) logic is stronger than constructive (minimal) logic	256
Exercises	256
IX.5.	Non-cumulative dialectical models	257
	mathematicians, companies of —; kinds of non-cumulative logic; rationality	257
Chapter X.	Semantic tableaux	258
	method for finding out whether a sequent is model-theoretically valid	258
X.1.	Semantic tableaux for classical implication	259
	evaluation problem, validity problem (Π/Γ); reduction rule, trivial evaluation problem, trivially valid; $\rightarrow R, \rightarrow L$ (rules for the conditional)	259–260
Lemma 1	M is a model for the sequent on the left \Leftrightarrow M is a model for at least one sequent on the right	260
C (Closure Rule)	260
Def. 1	a. <i>classical semantic tableau for a sequent, based on a system of reduction rules</i> ; b. <i>closed classical semantic tableau</i>	261
Def. 2	KIst	261
Lemma 2	a closed semantic tableau (KIst) is finite	261
Theorem 16	closed classical semantic tableau (KIst) \Rightarrow sequent is classically valid . . .	261
Def. 3	U has had sufficient attention by the (left/right) rules, concerning Π/Γ	263
Def. 4	open sequent	264

Def. 5	<i>Hintikka sequent</i>	264
Lemma 3	Hintikka sequents are classically invalid	265
Lemma 4	tableau for Π/Γ containing Hintikka sequent shows classical invalidity of Π/Γ	265
	directives (A), (B), (C) for constructing semantic tableaux (K1st)	266
Lemma 5	tableau constructed in accordance with (C) will close or yield Hintikka sequent	266
Theorem 17	(<i>first completeness theorem</i>) sequent is classically valid \Rightarrow a closed semantic tableau can be constructed	267
Def. 6	a. <i>decision procedure</i> ; b. <i>decidable</i> concept	267
Theorem 18	(<i>first decidability theorem</i>) a. 'classical validity' is a decidable concept; b. to construct a semantic tableau in accordance with our directives is to apply a decision procedure	267
Exercises	268
X.2.	The theory of classical semantic tableaux, for languages of the forms \mathcal{T} and \mathcal{T}^Λ	269
	& L, & R (rules for conjunction), \vee L, \vee R (rules for veljunction), \sim L, \sim R (rules for negation)	269
Lemma 6	[\approx Lemma 1]	269
CA	(a new closure rule)	269
Def. 7	a. KNst; b. K Λ st	270
Lemma 7	[\approx Lemma 2]	270
Theorem 19	[\approx Theorem 16]	270
Def. 8	<i>sufficient attention</i>	271
Lemma 8	[\approx Lemma 3 and Lemma 4]	271
	directive (C')	273
Lemma 9	[\approx Lemma 5]	273
Theorem 20	(<i>second completeness theorem</i>) [\approx Theorem 17]	273

Theorem 21	(<i>second decidability theorem</i>) [\approx Theorem 18]	273
Exercises		273
X.3.	The theory of constructive semantic tableaux	274
Def. 9	a. <i>model for a set of sequents</i> ; b. <i>constructively (minimally) valid set of sequents</i>	274
$\rightarrow R^c (= \rightarrow R^m)$, $\rightarrow L^c (= \rightarrow L^m)$	(rules for the conditional), $C^c (= C^m)$ (a closure rule)	275–276
Def. 10	CIst, MIst	276
Def. 11	a. <i>constructive (minimal) semantic tableau for a set of sequents, based on a system of reduction rules</i> ; b. <i>constructive (minimal) semantic tableau for a sequent</i> ; c. <i>closed constructive (minimal) semantic tableau</i>	276
compartment; <i>Convention 1</i> : dashes and dots; <i>Convention 2</i> : order of rule applications; $\& L^c$ ($= \& L^m$), $\& R^c (= \& R^m)$ (rules for conjunction); $\vee L^c (= \vee L^m)$, $\vee R^c (= \vee R^m)$ (rules for veljunction); $\sim L^c$, $\sim R^c$ (rules for negation); CA^c (a closure rule)		276–279
Lemma 10	M is a model for the set of sequents on the left \Leftrightarrow M is a model for at least one of the sets of sequents on the right	279
Def. 12	a. CNst; b. CAst	279–280
Lemma 11	a closed semantic tableau (CIst, CNst, CAst) is finite	280
Theorem 22	closed constructive semantic tableau \Rightarrow (set of) sequent(s) is constructively valid	280
Def. 13	<i>in the set Σ, the sentence U has had sufficient attention by the (left/right) rules concerning the sequent Π/Γ</i>	281
Def. 14	<i>open set of sequents</i>	281
Def. 15	<i>Hintikka set (of sequents)</i>	282
Lemma 12	Hintikka sets are constructively invalid.	282

Lemma 13	tableau for Σ containing Hintikka set shows that Σ is constructively invalid . . .	283
Def. 16	a. <i>creative rules, normal rules</i> ; b. <i>internally complete</i> (sequent)	285
directives (A), (B), (C)	286
Lemma 14	tableau constructed in accordance with (C) will close or yield Hintikka set . . .	286
Theorem 23	(<i>third completeness theorem</i>) (set of) sequent(s) is constructively valid \Rightarrow a closed constructive semantic tableau can be constructed	288
Theorem 24	(<i>third decidability theorem</i>) a. 'constructive validity' is a decidable concept; b. to construct a constructive semantic tableau in accordance with our directives is to apply a decision procedure	288
Exercises	288
X.4.	The theory of minimal semantic tableaux	289
	$\sim L^m, \sim R^m$ (rules for negation)	290
Def. 17	$MAst, MNst$	290
Lemma 15	[\approx Lemma 10]	290
Lemma 16	[\approx Lemma 11]	291
Theorem 25	[\approx Theorem 22]	291
Def. 18	<i>sufficient attention</i>	292–293
Lemma 17	[\approx Lemma 12]	293
Lemma 18	[\approx Lemma 13]	293
Lemma 19	[\approx Lemma 14]	294
Theorem 26	(<i>fourth completeness theorem</i>) [\approx Theorem 23]	295
Theorem 27	(<i>fourth decidability theorem</i>) [\approx Theorem 24]	295
The Theoretical Cube, dressed up (Figure X.2)	295
Exercises	296

Chapter XI.	The unity of the garbs – and what next	297
	the unity of the garbs and of the methods in (elemen- tary) modern logic	297
XI.1.	How to prove the missing link	297
	Theorem 28 (<i>stated</i>) a semantic tableau for Π/Z is closed \Rightarrow there is a P-winning strategy for $\Pi/O Z$. . .	297
XI.2.	Constructive and minimal systems. Equivalences con- cerning the existence of winning strategies	298
	Lemma 1	299
XI.3.	Classical systems. Equivalences concerning the existence of winning strategies	300
	Lemma 2	300
XI.4.	Classical systems. From closed semantic tableau to winning strategy for the Proponent	300
	Lemma 3 closed semantic tableau for $\Pi/\Gamma \Rightarrow$ P-winning strategy for $\Pi/P \Gamma$ (classical systems)	301
	Exercise	302
XI.5.	Constructive and minimal systems. From closed seman- tic tableau to winning strategy for the Proponent	302
	Lemma 4 closed semantic tableau for $\Sigma \Rightarrow$ for at least one $\Pi/\Gamma \in \Sigma$, there is a P-winning strategy for $\Pi/P \Gamma$ (constructive and minimal systems)	302
	Exercise	305
XI.6.	Full circle	305
	Theorem 28 (<i>proved</i>)	305
	schematic survey (Figure XI.1)	306
	Theorem 29 the unity of the garbs	306
	consequence: Gentzen's <i>Hauptsatz</i>	307
XI.7.	What next in the Theory of Argumentation?	307

Chapter XII.	From ontology to flux of opinions	309
	<i>ratio</i> ; traditional logic, neglect of fallacy, ontology . .	309
XII.1.	Ontology and discussion: Two paradigms in logic and epistemology	309
	two contrary paradigms	309–310
XII.2.	How to generate the object of ontology	310
	APA (Aristotle's – and Plato's – Principle of the Absolute), ω_{Rel} ; R^{as} (asymmetric relation obtained from R); $\omega_{R^{as}}$, d^* (Being)	310–312
XII.3.	The logic of the final state. Ontological valuation	312
	(ultimate) ontological valuation ($Sem^{\rightarrow ont}$, $Sem^{\sim ont}$) in a constructive model satisfying APA	312
XII.4.	The notions 'Truth' and 'Falsity'	313
	'the (absolute, final) set of dialectical or material procedures	314
XII.5.	Instantaneous (etc.) ontology	314
	True-at-t, False-at-t	314
XII.6.	Model theory and ontology. The Replacement Theory of the Notion of Truth	315
XII.7.	From dialectics <i>ad quem</i> to dialectics <i>a quo</i>	315
	<i>terminus ad quem</i> ; vectorial mode of thought; <i>terminus a quo</i>	315–316
Bibliography	317
Index of names	327
Index of subjects	329

A List of Variables

	<i>A value of the variable</i>	<i>is a(n)</i>
problem situation	γ	company, dialectical subject
	π	logico-intellectual language problem discerned by a company γ
older philosophical notions, analysis of —	—	—
	d	dialectical situation of a company/dialectical subject γ
	D	set of dialectical situations d
	R	development relation, to be defined on D
	R^{as}	asymmetric relation obtained from R
	$\omega_R, \omega_{R^{as}}$	conceptual result of applying Aristotle's Principle of the Absolute to R (to R^{as})
	T	type of sentence tag for indicating <i>objective truth</i> [ontological value, truth value]
	F	type of sentence tag for indicating <i>objective falsity</i> [ontological value, truth value]
purely descriptive languages	S [see below]	ontological structure $\langle T, F \rangle$
	σ	language system or principle, (system of) rule(s) for uses of language; — considered by γ in pursuit of/ as/ a solution to π
	\mathcal{L}	language (lexicon — here a set of atomic sentences —, logical constants, and syntactic rules), purely descriptive (declarative) —
	Λ	veljunction of all absurd/decidedly false sentences
	\mathcal{L}^Λ	language containing at least one absurd/decidedly false sentence
	T, \dots, Z	sentence

classical (ontological) semantics	I [see below]	classical (ontological) interpretation of a language \mathcal{L} (here, function from atomic sentences to the elements of $\{\mathbf{T}, \mathbf{F}\}$)
	M [see below]	classical (ontological) model $\langle \mathcal{S}, \mathbf{I} \rangle = \langle \mathbf{T}, \mathbf{F}, \mathbf{I} \rangle$ with respect to a language \mathcal{L}
	v_M [see below]	classical valuation (function) of (the sentences of) a language \mathcal{L} , induced by a classical (ontological) model M
formal ₃ dialectics	N	dialectical role, e.g., Proponent or Opponent
	$\mathcal{L}_D, \mathcal{L}_D^\Delta$	dialectically augmented language
	T, \dots, Z	statement
	T, T_1, T_n	thesis, initial thesis, nth local thesis
	Con, Con_1, Con_n	set of concessions, set of initial concessions, nth set of local concessions
	s	stage in a dialogue/discussion
	S	dialogue situation (constellation of rights, obliga- tions and attitudes, at the beginning of a chain of arguments or at the completion of some stage s)
	aU	verbal attack on U
	dU	move in defense of U against the attack aU
	ca	counteractive/indirect defense (counter-attack)
	pU	protective/direct defense of U
	$a_i U$	sentence used in an attack on U of the i'th kind
	$p_{ij} U$	sentence used in a protective defense of U of the j'th kind, against an attack on U of the i'th kind
	Π Π_0	set of $\left\{ \begin{array}{l} \text{implicitly} \\ \text{explicitly} \end{array} \right\}$ accepted sentences (based on some material truth procedure adopted by γ)
	\mathbb{F} \mathbb{F}_0	set of $\left\{ \begin{array}{l} \text{implicitly} \\ \text{explicitly} \end{array} \right\}$ rejected sentences (based on some material falsity procedure adopted by γ)

dialectical semantics	A	type of sentence tag for indicating <i>positive agreement</i> on a sentence (in some dialectical situation d and by some dialectical subject γ) [dialectical value]
	N	type of sentence tag for indicating <i>lack of positive agreement</i> on a sentence [dialectical value]
	Abs	set of absurd dialectical situations
	S	dialectical structure, normal: $\langle \mathbf{A}, \mathbf{N}, \mathbf{D}, \mathbf{R} \rangle$, or minimal: $\langle \mathbf{A}, \mathbf{N}, \mathbf{D}, \mathbf{Abs}, \mathbf{R} \rangle$
	I	interpretation of a language \mathcal{L} or \mathcal{L}^Δ on a dialectical structure (here, function from atomic sentences and dialectical situations to the elements of $\{\mathbf{A}, \mathbf{N}\}$)
	M	dialectical model $\langle \mathbf{S}, \mathbf{I} \rangle = \langle \mathbf{A}, \mathbf{N}, \mathbf{D}, \mathbf{R}, \mathbf{I} \rangle$ (or $= \langle \mathbf{A}, \mathbf{N}, \mathbf{D}, \mathbf{Abs}, \mathbf{R}, \mathbf{I} \rangle$) of a language \mathcal{L} or \mathcal{L}^Δ
	v_M	constructive or minimal valuation (function) of (the sentences of) a language \mathcal{L} or \mathcal{L}^Δ , induced by a dialectical model M
τ		tableau, tree diagram
Beth-tableaux	Π [see below]	set of sentences: premises in a deduction problem, or sentences to be given the value T (or the value A) in a solution of a valuation problem
	Γ [see below]	set of sentences: those which in a solution of a valuation problem are to be given the value F (or the value N)
	Z	concludendum (a sentence)
	S [see below]	sequent Π/\mathbf{Z} or Π/Γ — characterizes a deduction/valuation problem; partial description of a dialectical situation d
	Σ	set of sequents; partial description of a dialectical model

dialogical strategy tableaux	Π	set of sentences: those stated as concessions
	Δ	set of sentences: those representing structural protective defense rights on the Opponent's side
	Φ	set containing at most one sentence, viz., the one uttered by the Proponent in the preceding stage
	Γ	set of sentences: those representing structural protective defense rights on the Proponent's side
	$\vec{\Pi}, \vec{\Delta}, \vec{\Phi}, \vec{\Gamma}$	sequences of sentences (compare $\Pi, \Delta, \Phi, \Gamma$)
	T	<div> <div> sentence stated in the local thesis T </div> <div> set of sentences, viz., the set of <i>all</i> sentences that are stated in local theses up to a certain stage </div> </div>
