

CONTENTS

List of basic notations and assumptions	xvii
Preface and some historical remarks	xx
Chapter 1. Introduction to the theory of sample matrices of fixed dimension	1
1. Perturbation formulae for eigenvalues and eigenvectors of matrix	1
2. Measurability and nondegeneracy of eigenvalues of random matrices	3
3. Maximum likelihood estimates of the parameters of a multivariate normal distribution	4
4. Wishart density $w_n(\vec{a}, R)$	4
5. Generalized variance	4
6. Symmetric random real matrices	5
7. Random Hermitian matrices	6
8. Random antisymmetric matrices	6
9. Distribution of roots of a random polynomial with real coefficients	8
10. Expected number of real roots of a random polynomial with real coefficients	9
11. Expected number of real roots of a random real analytic function	11
12. Distribution of roots of a random polynomial with complex coefficients	11
13. Average density of complex roots of a random polynomial with complex coefficients	12
14. Expected normalized counting functions of the roots of the random polynomial obtained by V -transform	13
15. V -distribution of the roots of a random polynomial	16
16. Calculation of expected logarithm of the absolute value of a random polynomial	18
17. Distribution function of the eigenvalues of a random nonsymmetric real matrix when its eigenvalues are real	20
18. Random nonsymmetric real matrices	23
19. Random nonsymmetric real matrices with special form of selected eigenvectors	35
20. Random complex matrices	36
21. Random complex symmetric matrices	37
22. Random complex antisymmetric matrices	37
23. Distribution of triangular decomposition of random complex matrices	38
24. Distribution of triangular decomposition of unitary invariant random complex matrices	39
25. Distribution of the triangular decomposition of the triangular random complex matrices	39
26. Random unitary matrices	40
27. Orthogonal random matrices	41
28. The method of triangular matrices for rigorous derivation of the distribution function of eigenvalues of Gaussian nonsymmetric real matrix (Girko, 1980)	44
29. Straight and back spectral Kolmogorov equations for densities of eigenvalues of random symmetric matrix processes with independent increments	47

30. Spectral stochastic differential equations for random symmetric matrix processes with independent increments	48
31. Spectral stochastic differential equations for random matrix-valued processes with multiplicative independent increments	49
32. Asymptotics of eigenvalues and eigenvectors of empirical covariance and correlation matrices of fixed dimension	49
Chapter 2. Canonical equations	51
1. Canonical equation K_1	51
2. Canonical equation K_2	53
3. Canonical equation K_3 for symmetric random matrices with infinitely small entries	57
4. Canonical equation K_4 for symmetric random matrices with infinitely small entries	58
5. Canonical equation K_5 for symmetric random matrices with infinitely small entries	59
6. Canonical equation K_6 for symmetric random matrices with identically distributed entries	60
7. Canonical equation K_7 for random Gram matrix	61
8. Canonical equation K_8	64
9. Canonical equation K_9 for random matrices whose entries have identity variances	65
10. Canonical equation K_{10}	66
11. Canonical equation K_{11} . Limit theorem for normalized spectral functions of empirical covariance matrices under the modified Lindeberg condition	71
12. Canonical equation K_{12} for random Gram matrices with infinitely small entries	75
13. Canonical equation K_{13} for random Gram matrices with infinitely small entries	76
14. Canonical equation K_{14} for random Gram matrices with infinitely small entries	78
15. Canonical equation K_{15} for random Gram matrices with identically distributed entries	79
16. Canonical equation K_{16}	79
17. Canonical equation K_{17}	83
18. Canonical equation K_{18}	84
19. Canonical equation K_{19}	84
20. Canonical equation K_{20}	86
21. Canonical equation K_{21} for random matrices with independent pairs of entries	87
22. Canonical equation K_{22} for random matrices with independent pairs of entries which have zero expectation. Circular and Elliptic Laws	89
23. Canonical equation K_{23} for random matrices with independent pairs of entries which have different covariances and zero expectations	90
24. Canonical equation K_{24} for random G -matrices with infinitesimally small random entries	92
25. Canonical equation K_{25} for random G -matrices.	

Strong V -law	94
26. Canonical V -equation K_{26} . The V -density of eigenvalues of random matrices, the variances of the entries of which form a doubly stochastic matrix	95
27. Canonical equation K_{27} for normalized spectral functions of random symmetric matrices with independent blocks	100
28. Canonical equation K_{28} for normalized spectral functions of random symmetric matrices with identically distributed independent blocks	105
29. Canonical equation K_{29} . SS -Law	105
30. Canonical equation K_{30} for Fourier transform of resolvent of symmetric block random matrix	106
31. Canonical equation K_{31} for normalized spectral functions of random nonsymmetric matrices with independent blocks	110
32. Canonical equation K_{32} for normalized spectral functions of random nonsymmetric matrices with identically distributed independent blocks	114
33. Canonical equation K_{33} for Fourier transform of resolvent of Gram block random matrix	114
34. Canonical equation K_{34} for normalized spectral functions of empirical covariance matrix with asymptotically independent blocks	115
35. Canonical equation K_{35} for normalized spectral functions of random matrices pencil	118
36. Canonical equation K_{36} for normalized spectral functions of random matrices pencil	119
37. Canonical equation K_{37} for normalized spectral functions of empirical random matrices pencil	119
38. Canonical equation K_{38} for normalized spectral functions of random nonsymmetric matrices pencil	122
39. Stochastic canonical equation K_{39} for normalized spectral functions of random symmetric matrices	123
40. Stochastic canonical equation K_{40} for normalized spectral functions of random Gram matrices	124
41. Stochastic canonical equation K_{41} for normalized spectral functions of empirical covariance matrices	126
42. Stochastic canonical equation K_{42} for normalized spectral functions of random symmetrical matrices with block structure	127
43. Stochastic canonical equation K_{43} for normalized spectral functions of random nonsymmetric block matrices	128
44. Stochastic canonical equation K_{44} for normalized spectral functions of empirical covariance matrices with block structure	130
45. Stochastic canonical equation K_{45} for normalized spectral functions of random matrices pencil	131
46. Canonical equation K_{46} for normalized spectral functions of band random matrices	131
47. Dyson canonical equation K_{47} for normalized spectral functions of band random matrices	135
48. Canonical equation K_{48} for normalized spectral functions of product of random matrices	135

49. Canonical equation K_{49} for normalized spectral functions of product of random matrices	136
50. Canonical equation K_{50} for normalized spectral functions of random S -matrices	137
Chapter 3. The First Law for the eigenvalues and eigenvectors of random symmetric matrices	139
1. Introduction and historical review. Some important formulas	141
2. Strong law for normalized spectral functions of random matrices with stochastically independent row vectors	143
3. Strong law for the entries of resolvents of random matrices	146
4. Invariance principle for the entries of resolvents of random matrices	149
5. Limit theorem for eigenvalues and eigenvectors of random symmetric matrices when Lindeberg's condition is not fulfilled. Stochastic power method	154
6. Weak Limit Theorem for eigenvalues and eigenvectors of random symmetric matrices when Lindeberg's condition is fulfilled. REFORM method	155
7. Accompanying canonical equation K_1 for random symmetric matrices	156
8. Solution of the accompanying canonical equation is equal to the vector of Stieltjes' transforms of certain distribution functions. Method of extending random matrices	157
9. Uniqueness and boundedness of the solution of the accompanying spectral equation L_1	158
10. Equation C_1 for the boundary points of accompanying spectral density	160
11. Existence of the solution of accompanying equation L_1	163
12. Proof of the existence of the density of accompanying normalized spectral function based on the uniqueness of the solution of spectral equation L_1	163
13. Uniform inequality for normalized spectral functions of random symmetric matrices	166
14. Invariance principle for the traces of resolvents of random matrices for the case of convergence of random eigenvalues in probability	167
15. Invariance principle for random matrices for the case of convergence of random eigenvalues with probability one	169
16. Main equation M_1 for random symmetric matrices	170
17. Equation for the sum of smoothed distribution functions of eigenvalues of a random symmetric matrix for the case of convergence of random eigenvalues in probability	178
18. Equation for the sum of smoothed distribution functions of eigenvalues of a random symmetric matrix for the case of convergence of random eigenvalues with probability one	179
19. Double F -method for finding limits of eigenvalues for the case of convergence of random eigenvalues in probability	180
20. Double F -method for finding limits of eigenvalues for the case of convergence of random eigenvalues with probability one	183
21. Structure of the accompanying density. Limit theorems for extreme eigenvalues of random matrices	183

22. Weak limit theorem for eigenvalues of random symmetric matrices	188
23. Strong limit theorem for eigenvalues of random symmetric matrices	191
24. Main assertions	191
25. Correlation function of random eigenvalues	193
Chapter 4. The Second Law for the singular values and eigenvectors of random matrices. Inequalities for the spectral radius of large random matrices	201
1. Introduction and historical review	202
2. Strong law for normalized spectral functions of random matrices with stochastically independent column or row vectors	204
3. Strong law for the entries of resolvents of random matrices	205
4. Invariance principle for the entries of resolvents of random matrices	209
5. Limit theorem for eigenvalues and eigenvectors of random Gram matrices when Lindeberg's condition is not fulfilled. Stochastic power and integral representation methods	215
6. Weak limit theorem for eigenvalues and eigenvectors of random Gram matrices when Lindeberg's condition is fulfilled. Stochastic power and integral representation methods	216
7. Accompanying canonical equation K_{26} for random Gram matrices	217
8. Solution of the accompanying canonical equation is equal to Stieltjes' transform of a certain distribution function. Method of extending random matrices	218
9. Uniqueness and boundedness of the solution of the accompanying spectral equation L_2	219
10. Canonical equation L_2 and C_2 for the boundary points of G -density	222
11. Existence of the solution of accompanying spectral equation L_2	228
12. Proof of the existence of the density of accompanying normalized spectral functions based on the uniqueness of the solution of the spectral equation L_2	228
13. Uniform inequality for normalized spectral functions of random Gram matrices	229
14. REFORM method of deriving the main equation M_3 of spectral theory of random matrices	230
15. Inequalities for the coefficients of the main equation M_3	233
16. Calculations of coefficients of the main equation M_3 for the case of convergence of random eigenvalues in probability	236
17. Calculations of the coefficients of the main equation M_4 for the case of convergence of random eigenvalues with probability one	239
18. Invariance principle for the traces of resolvents of random matrices for the case of convergence of random eigenvalues in probability	247
19. Invariance principle for random matrices for the case of convergence of random eigenvalues with probability one	250
20. Equation for the sum of smoothed distribution functions of singular values of random matrices for the case of convergence of random eigenvalues in probability	261
21. Equation for the sum of smoothed distribution functions of singular values of random matrices. Convergence of random eigenvalues with probability one	262
22. Double F -method for finding the boundaries of extremal	

eigenvalues. Convergence of eigenvalues in probability	263
23. Double F -method for finding the boundaries of extremal eigenvalues. Convergence of eigenvalues with probability one	267
24. The Second Law for the singular values of random matrices	268
25. Strong Law for eigenvectors of random matrices	273
26. Strong Law for the spectral radius of large random matrices	274
Chapter 5. The Third Law for the eigenvalues and eigenvectors of empirical covariance matrices	277
1. Introduction and historical review	278
2. Some auxiliary formulas	280
3. Strong law for normalized spectral functions of random matrices with stochastically independent row vectors	280
4. Strong Law for the entries of resolvents of random matrices	282
5. Invariance principle for the entries of resolvents of random matrices	285
6. Limit theorem for eigenvalues and eigenvectors of empirical matrices under the G -condition when Lindeberg's condition is not fulfilled. Stochastic power methods	286
7. Weak limit theorem for eigenvalues and eigenvectors of empirical covariance matrices when Lindeberg's condition is fulfilled. REFORM method	287
8. Accompanying canonical equations for empirical covariance matrices	288
9. Solution of the accompanying canonical equation is equal to the Stieltjes transform of certain distribution functions. Method of extending random matrices	289
10. Canonical equation L_3 for G -density	289
11. Existence of the solution of accompanying equation L_3	289
12. Uniqueness and boundedness of the solution of the accompanying equation L_3	289
13. Equation C_3 for the boundary points of spectral density	290
14. Boundedness of the boundary points of spectral density	293
15. Proof of the existence of the density of accompanying normalized spectral functions based on the uniqueness of the solution of spectral equation L_3	293
16. Uniform inequality for normalized spectral functions of random symmetric matrices	294
17. REFORM method of deriving the main equation M_5 of spectral theory of random matrices	295
18. Inequalities for the coefficients of the main equation M_5	296
19. Calculations of the coefficients of the main equation M_5 for the case of convergence of normalized spectral functions in probability	299
20. Calculations of the coefficients of the main equation M_6 for the case of convergence of normalized spectral functions with probability one	302
21. Invariance principle for the traces of resolvents of random matrices for the case of convergence of random eigenvalues in probability	303
22. Invariance principle for random matrices for the case of convergence of random eigenvalues with probability one	311
23. Equation for the sum of smoothed distribution functions of singular values of random matrices for the case of convergence of random eigenvalues in probability	312

24. Equation for the sum of smoothed distribution functions of singular values of random matrices. The case of convergence of random eigenvalues with probability one	312
25. Double F -method. Weak limit theorem for eigenvalues of empirical covariance matrices	313
26. Strong limit theorem for eigenvalues of empirical covariance matrices	316
27. The Third Law for the eigenvalues and eigenvectors of empirical covariance matrices	322
Chapter 6. The first proof of the Strong Circular Law	325
1. Historical review and an outline of the proof of the Strong Circular Law	326
2. V -transform of spectral functions	328
3. Limit theorems like the strong law of large numbers for normalized spectral functions of nonselfadjoint random matrices with independent entries	331
4. The regularized V -transform for a spectral function	337
5. Estimate of the rate of convergence of Stieltjes' transform of spectral functions	339
6. The estimates of the deviations of spectral functions from the limit functions	345
7. Strong circular law	346
Chapter 7. Strong Law for normalized spectral functions of nonselfadjoint random matrices with independent row vectors and simple rigorous proof of the Strong Circular Law	349
1. Modified V -transform of spectral functions	349
2. Inverse formula for modified V -transform	351
3. Strong law for normalized spectral functions of nonselfadjoint random matrices with independent row vectors	351
4. The method of perpendiculars for proving the Strong Circular Law	359
5. Substitution of the determinant of a Gram matrix for the determinant of a random matrix	359
6. The regularized modified V -transform for a spectral function	364
7. The rigorous proof of the Strong Circular Law	367
Chapter 8. Rigorous proof of the Strong Elliptic Law	369
1. Modified V -transform of spectral and G -functions	370
2. A criticism of an inverse formula for the modified V -transform	370
3. The method of perpendiculars for proving the Strong Elliptic law. Resolvent formulas for matrix with independent pairs in its entries	372
4. Strong law for normalized spectral functions of nonselfadjoint random matrices with independent pairs in entries	374
5. Substitution of the determinant of a Gram matrix for the determinant of a random matrix	380
6. The regularized modified V -transform for the spectral function	386
7. Useful integral	390
8. The canonical equation	391
9. Calculation of a specific integral for the solution of the canonical	

equation K_{22}	394
10. Invariance principle for random matrices	396
11. Canonical equation. Limit theorem for G -functions	398
12. Strong Elliptic Law	402
Chapter 9. The Circular and Uniform Laws for eigenvalues of random nonsymmetric complex matrices with independent entries	405
1. Truncated conditional V_1 -transform and V_2 -transform	405
2. Canonical spectral equation and the boundary points of spectral density	406
3. Strong law for G -functions $\mu_n(x, \tau)$	407
4. Limit theorems for G -functions. Canonical equation K_{26}	408
5. The REFORM method of obtaining the main equation of spectral theory of random matrices	408
6. Invariance principle for random matrices	409
7. The equation for the sum of smoothed distribution functions of eigenvalues of random matrices	413
8. Method of Fourier and inverse Fourier transforms for finding boundaries of eigenvalues	414
9. Limit theorem for the singular values of random matrices	420
10. Method of perpendiculars for proving the Strong Circular Law	421
11. Central limit theorem for randomly normalized random determinant	421
12. Substitution of entries of normally distributed random variables for random matrix	423
13. Substitution of determinant of Gram matrix for determinant of random matrix	424
14. Regularized V_3 -transform	427
15. Regularized V_4 -transform. Circular Law	429
16. Limit theorems for eigenvalues of random nonsymmetric matrices	432
Chapter 10. Strong V -Law for eigenvalues of nonsymmetric random matrices	435
1. Strong Law for normalized spectral functions of nonselfadjoint random matrices with independent row vectors	436
2. Substitution of the determinant of Gram matrix for the determinant of random matrix	437
3. Regularized modified V -transform for the spectral function	442
4. Limit theorem for Stieltjes' transform of spectral functions. Canonical spectral equation K_7	446
5. The Strong V -Law	447
6. The V -density of eigenvalues of random matrices with independent entries	450
7. One example of the V -density for eigenvalues of random matrices with independent entries	451
Chapter 11. Convergence rate of the expected spectral functions of symmetric random matrices is equal to $O(n^{-1/2})$	453
1. Introduction and historical review	453
2. Hermite polynomials	454
3. Christoffel-Darboux formula	455

4. Formula for the average spectral density of Gaussian Hermitian matrices	455
5. Integral formula for the Hermite polynomials	456
6. Method of steepest descent. The first main asymptotic formula for Hermite polynomials	457
7. The second main asymptotic formula for Hermite polynomials	464
8. Structure of the Semicircle Law	465
9. "Imaginary logarithmic" inequality for the expected normalized spectral functions	466
10. Inequality for random normalized spectral functions	470
11. Inequality for the heavy tails of normalized spectral functions outside of interval $ x > 2 + c$, $c > 0$	471
12. REFORM and martingale differences methods of deriving the first main inequality	473
13. The invariance principle for symmetric random matrices with independent entries	476
14. Main equation for the resolvent of random symmetric matrix	480
15. Inequalities for the coefficients of the main equation	481
16. Important lemma	482
17. Calculations of coefficients of the main equation	482
18. Equation for the sum of smoothed distribution functions of eigenvalues of random symmetric matrix	483
19. The double F -method for finding the second main inequality for spectral functions	484
20. Convergence rate of expected normalized spectral functions of the Hermitian Gaussian matrices outside of the interval $ x < 2 - cn^{-1/3}$, $c > 0$	485
21. The third main inequality	485
22. The fourth main inequality	486
23. Inequality for the distance between expected normalized spectral function and Semicircle Law	489
24. Inequality for the expected maximal distance between normalized spectral function and Semicircle Law	491
25. Convergence rate for eigenvalues of random symmetric matrices	492
26. Convergence rate of expected normalized spectral functions outside of the interval $ x > 2 + c$, $c > 0$	493
Chapter 12. Convergence rate of expected spectral functions of the sample covariance matrix $\hat{R}_{m_n}(n)$ is equal to $O(n^{-1/2})$ under the condition $m_n n^{-1} \leq c < 1$	495
1. Introduction and historical review	495
2. Laguerre polynomials. The basic properties	497
3. Orthonormalized Laguerre functions	499
4. Asymptotics of Laguerre polynomials in scheme of series	500
5. Method of steepest descent. The first main asymptotic formula for Laguerre polynomials	502
6. The second main asymptotic formula for Laguerre polynomials	513
7. Convergence rate for normalized spectral functions of Gaussian Gram matrices	516
8. REFORM and martingale-differences methods of deriving the first	

main inequality	518
9. Invariance principle for symmetric random matrices with independent entries	523
10. The second main inequality	527
11. The third main inequality	527
12. Double F -method for finding the boundaries of eigenvalues	529
13. Convergence rate of expected normalized spectral functions outside of a certain region	529
14. Convergence rate of normalized spectral function of empirical covariance matrices is equal to $O(n^{-1/2})$	531
15. The main fifth inequality for the expected maximal distance between a normalized spectral function and the limit law	532
16. Convergence rate for eigenvalues of sample covariance matrices	533
17. Convergence rate of expected normalized spectral functions outside of the domain $4\gamma - (1 + \gamma - x)^2 > c$	533
Chapter 13. The First Spacing Law for random symmetric matrices	535
1. Introduction and historical review. Monte Carlo approach to quantum mechanics	535
2. Spacings and their spectral functions	537
3. Expected spacing spectral functions	538
4. Expected truncated spacing spectral functions	539
5. Gaussian representation of probability that an interval contains no eigenvalues	539
6. Integral representation of the expected normalized spacing spectral functions	540
7. Limits for Hermite polynomials	541
8. Semicircle Law for Gaussian Hermitian matrices	544
9. Spectral density outside of the Semicircle Law	544
10. Limit theorem for normalized spacing spectral functions	545
11. The first spacing law	545
12. Limit of expected normalized spectral function of the spacings of the squares of eigenvalues	546
13. Wigner surmise	547
14. Mathematical formulation of the Wigner surmise	547
15. Mean level distance $D_n(\lambda_{\max} - \lambda_{\min})$	548
16. Limit theorem for the local mean level distance $D_n(\alpha_n)$	548
17. Local limit average density for spacings of Hermitian Gaussian matrices	549
18. Histograms of eigenvalues of random matrices	551
19. Histograms of a part of eigenvalues of random matrices	552
Chapter 14. Ten years of General Statistical Analysis (The main G-estimators of General Statistical Analysis)	553
1. G_1 estimator of generalized variance	556
2. G_2 -estimator of the real Stieltjes transform of the normalized spectral function of covariance matrices	557
3. G_3 -estimator of inverse covariance matrix	560
4. Class of G_4 -estimators for the traces of the powers of covariance matrices	561

5. G_5 -estimator of smoothed normalized spectral function of symmetric matrices	562
6. G_6 -estimator of Stieltjes' transform of covariance matrix pencil	563
7. G_7 -estimator of the states of discrete control systems	566
8. Class of G_8 -estimators of the solutions of systems of linear algebraic equations (SLAE)	571
9. G_9 -estimator of the solution of the discrete Kolmogorov-Wiener filter	575
10. G_{10} -estimator of the solution of a regularized discrete Kolmogorov-Wiener filter with known free vector	576
11. G_{11} -estimator of the Mahalanobis distance	579
12. G_{12} -regularized Mahalanobis distance estimator	580
13. Discrimination of two populations with common unknown covariance matrix. G_{13} -Anderson-Fisher statistics estimator	581
14. G_{14} -estimator of regularized discriminant function	582
15. G_{15} -estimator of the nonlinear discriminant function, obtained by observation of random vectors with different covariance matrices	583
16. Class of G_{16} -estimators in the theory of experimental design, when the design matrix is unknown	584
17. G_{17} -estimate of T^2 -statistics	589
18. G_{18} -estimate of regularized T^2 -statistics	589
19. Quasi-inversion method for solving G -equations	590
20. Estimator G_{20} of regularized function of unknown parameters	595
21. G_{21} -estimator in the likelihood method	596
22. G_{22} -estimator in the classification method	598
23. G_{23} -estimator in the method of stochastic approximation	600
24. Class of estimators G_{24} , which minimizes the certain mean-square risks	601
25. G_{25} -estimator of the Stieltjes transform of the principal components	602
26. G_{26} -estimator of eigenvalues of the covariance matrix	603
27. G_{27} -estimators of eigenvectors corresponding to extreme eigenvalues of the covariance matrix	607
28. G_{28} consistent estimator of the trace of the resolvent of the Gram matrix	608
29. G_{29} -consistent estimator of singular values of the matrix	609
30. G_{30} -consistent estimator of eigenvectors corresponding to extreme singular values of the matrix	610
31. G_{31} -estimator of the resolvent of a symmetric matrix	611
32. G_{32} -estimator of eigenvalues of a symmetric matrix	616
33. G_{33} -estimator of the eigenvector which corresponds to the extreme eigenvalues of a symmetric matrix	618
34. G_{34} -estimator of the V -transform	620
35. G_{35} -estimators of eigenvalues of random matrices with independent pairs of entries	621
36. G_{36} -estimator of eigenvectors of matrices with independent pairs of entries	622
37. G_{37} -estimator of the U -statistic	623

38. G_{38} -estimators of symmetric functions of eigenvalues of covariance matrices	624
39. G_{39} -estimator of symmetric function of eigenvalues of Gram random matrix	626
40. G_{40} -estimator of permanent of matrix	626
41. Method of random determinants. Class G_{41} -estimates of the permanent of a matrix	627
42. G_{42} -estimator of a product of matrices	629
43. G_{43} -estimator of product of matrices in the scheme of series	630
44. Class of G_{44} -estimators of solutions of the system of linear differential equations with covariance matrix of coefficients	631
45. Class of G_{45} -estimators of solutions of the system of linear differential equations with non-negative defined matrix of coefficients	633
46. G_{46} -estimator for solution of the system of linear differential equations with symmetrical matrix of coefficients	634
47. G_{47} -estimator for solution of the system of linear differential equations	635
48. G_{48} -estimator for solution of the system of linear differential equations when coefficients have arbitrary variances	639
49. G_{49} -estimator for solution of the system of linear differential equations with symmetric block structure	639
50. G_{50} -consistent estimator for solution of linear programming problem (LPP)	640
51. G_{51} -estimator of solutions of LPP	642
52. G_{52} -estimator of solution of LPP with nonsymmetric matrix A	643
53. G_{53} -estimator of solution of LPP obtained by integral representation method	644
54. G_{54} -estimator of solution of LPP with block structure	646
