

Contents

1	Introduction — 1
2	Preliminaries — 5
2.1	Coding theory — 5
2.1.1	Generalities — 5
2.1.2	Nearest neighbor algorithm and perfect codes — 8
2.1.3	Bounds — 10
2.1.4	Generalized Hamming weights — 11
2.1.5	Weight distribution and weight enumerator — 12
2.1.6	Cyclic codes — 13
2.2	Commutative algebra — 17
2.2.1	Generalities — 17
2.2.2	Chain conditions on modules — 19
2.2.3	Graded rings and modules, rings of polynomials — 21
2.2.4	Rings of fractions — 23
2.2.5	Primary decomposition — 24
2.2.6	Dimension theory — 26
2.2.7	Some algebraic geometry — 28
2.2.8	Hilbert function and degree — 36
2.2.9	Graded free resolutions — 39
2.2.10	Monomial orders — 51
2.3	Combinatorics — 61
2.3.1	Simplicial complexes — 61
2.3.2	Matroids — 65
2.3.3	Hyperplane arrangements — 67
2.3.4	Weight enumerators and hyperplane arrangements — 71
3	Ideals generated by fold products of linear forms — 73
3.1	Ideals generated by a -fold products of linear forms — 74
3.2	The De Boer–Pellikaan method for computing minimum distance — 76
3.2.1	Minimum distance and heights of ideals — 76
3.2.2	Generalized Hamming weights — 79
3.3	Projective codewords of minimum weight — 81
3.3.1	Parity-check matrix approach — 83
3.3.2	Primary decomposition approach — 84
3.3.3	Minimal codewords — 86
3.4	Primary decomposition of ideals generated by a -fold products of linear forms — 89
3.4.1	The general case — 92
3.4.2	Star configurations — 98

3.5	An error-correction algorithm —	100
3.6	Linear codes interpolation —	103
3.6.1	Subspace arrangements and subcodes —	105
3.6.2	Interpolating fat points in $\mathbb{P}^{k-1}$ —	106
3.6.3	Interpolating reduced points with given regularity —	109
3.7	Minimum distance as the initial degree —	116
3.7.1	The Fitting module of a linear code —	117
3.7.2	A binary associated graded algebra —	119
4	Fat points defining linear codes —	122
4.1	Geometry of minimum distance —	123
4.2	The minimum distance and the initial degree of points —	126
4.2.1	The reduced case —	127
4.2.2	The fat-points case —	132
4.3	The minimum distance and the minimum socle degree —	134
4.3.1	The case of reduced complete intersections —	140
4.4	Additional results for specific situations —	143
4.4.1	Minimum distance and the index of nilpotency —	143
4.4.2	Configurations of points associated to Steiner systems —	146
4.4.3	Fat points having complete intersection support —	149
5	Evaluation codes —	154
5.1	Reed–Muller codes —	156
5.1.1	Algebraic geometric and toric codes —	161
5.1.2	Affine variety codes —	164
5.2	Evaluation codes —	171
5.2.1	Evaluation codes of minimum distance one —	173
5.2.2	Points in general linear position —	175
5.2.3	Generalized Hamming weights of evaluation codes —	179
5.2.4	Codes constructed from graphs —	183
5.3	Parameterized codes —	186
5.3.1	Defining ideals of toric sets —	187
5.3.2	Techniques for parameterized codes —	190
5.3.3	Codes parameterized by projective torus —	193
5.3.4	Codes parameterized by graphs —	195
5.3.5	Veronese type codes —	200
5.4	Affine cartesian codes —	201
5.4.1	Projective nested cartesian codes —	204
5.5	The dual of an evaluation code —	205
5.5.1	Self-dual codes and Gale transforms —	209
5.5.2	Initial degree of inverse systems —	211

6 Additional topics — 212

- 6.1 Minimum distance and initial degrees of combinatorial algebras — **213**
- 6.1.1 Stanley–Reisner ring of matroids of generator matrices — **214**
- 6.1.2 The Orlik–Terao algebra — **220**
- 6.2 Minimum distance functions — **226**
- 6.2.1 Footprint function — **229**
- 6.2.2 The $\mathbf{v}$ -number of a graded ideal — **233**
- 6.2.3 The Cayley–Bacharach conjectures and the minimum distance function — **237**
- 6.2.4 Relative generalized minimum distance functions — **240**
