

flood events in Switzerland.⁵³ The precise geo-referencing of the images by specialists makes it possible to reconstruct the flood risk for many locations in Switzerland with pinpoint accuracy. Thirdly, new forms of knowledge transfer are needed between newcomers and people whose families have lived in the area for a long time (perhaps for centuries) and who know a lot about historical flood events through family tradition.⁵⁴ A higher sensitivity due to awareness of the climate crisis may help to draw attention to more disaster memory again.

About the Author

Christian Rohr is Full Professor of Environmental and Climate History at the University of Bern, working both at the Institute of History and the interdisciplinary Oeschger Centre for Climate Change Research. He studied history and ancient and medieval Latin at the University of Vienna, where he obtained his PhD in 1995. As Assistant Professor and later Associate Professor of Medieval History at the Institute of History at the University of Salzburg (1996–2010), his research started to concentrate on nature-induced disasters, climatic fluctuations, and conflicts over natural resources in the medieval and early modern period. Since 2010 he has widened his scope to include modern and contemporary environmental history.
