Abstract: 1-(2-Benzylthiopyrimidin-4-yl)-2-substituted benzimidazoles **6a-d** were prepared efficiently in four steps. Reaction of 2-thiouracil with benzyl chloride in presence of base, furnishes 2-benzylthiouracil **2**. This on chlorination with excess POCl₃ furnishes 4-chloro-2-benzylthiopyrimidine **3**. Compound **3** on reaction with *ortho*-phenylenediamine via aromatic nucleophilic displacement reaction yielded 4-(2-aminoanilino)-2-benzylthiopyrimidine **4**. This on cyclization with CS₂ in presence of base furnishes 1-(2-benzylthiopyrimidin-4-yl)-2-thiobenzimidazole **5**. Compound **5** on reaction with alkyl, aryl halides and hydrazine hydrate yielded target compounds **6a-d** in 52-62% yield.

Introduction Benzimidazole analogs with N-1 substitution showed antiviral activity¹ against human cytomegalovirus and herpes simplex virus type-1. The biological activities of these compounds depend upon the substitution on the benzimidazole at the N-1 or C-2 position. In continuation of earlier research in the field of synthesis and biological activities of N₁-substituted benzimidazoles² and substituted pyrimidines³⁻⁶, herein we report the synthesis of some hitherto unknown 1-(2-benzylthiopyrimidin-4-yl)-2-substituted benzimidazoles.

Experimental Melting points were determined by using a Thomas-Hoover melting point apparatus and were uncorrected. IR spectra in KBr disc were recorded on Perkin-Elmer-Spectrum-one FT IR spectrophotometer ($\nu_{\max}$ in cm⁻¹) and ¹H NMR spectra in DMSO-d₆ and/or CDCl₃ on amx 400, 400 MHz spectrophotometer using TMS as internal standard (chemical shift in δ or ppm). Mass spectra were recorded on a JEOL SX 102 Mass spectrometer using Argon/Xenon (6kv, 10 mA) as the FAB gas. Purity of the compounds was checked by TLC using silica gel 'G' plates obtained from Whatman Inc, and a fluorescent indicator. 2-Benzylthiouracil **2** and 4-chloro-2-benzylthiopyrimidine **3** were prepared by following the literature methods^{7,8}.
