

Supplemental Table 3. Comparison of cytokine levels in tissue homogenates of quadriceps from animals subjected to hindlimb suspension then eight days of re-ambulation (Re-A) or re-ambulation plus instrument-assisted soft tissue manipulation (Re-A+IASTM). Total protein was pooled at equal ratios for n=7 Re-A and n=8 Re-A+IASTM animals. Data are mean signal density relative to the average reference spot density normalized to Re-A. Green and pink highlight indicates $\geq 25\%$ increase or decrease, respectively, compared to Re-A.
