FI Factors

The FI factor of a complex is defined by the following equation:

$$FI_{complex} = \frac{I_{complex}}{I_{Solvens}}$$

Thereby $I_{complex}$ and $I_{Solvens}$ denote the intensity of a Cm(III) complex as well as the Cm(III) solvent complex both normalized to the energy of the excitation laser.

Due to their easier application to the experimental data, FI factors instead of fluorescence quantum yields or fluorescence quantum efficiencies are used in the presented work.

The FI factor of a species is not an absolute value. It depends on quantum yields and experimental setup. It is, therefore, not directly transferable to other systems.
