Statistical Applications in Genetics and Molecular Biology seeks to publish significant research on the application of statistical ideas to problems arising from computational biology. The focus of the papers should be on the relevant statistical issues but should contain a succinct description of the relevant biological problem being considered. The range of topics is wide and will include topics such as linkage mapping, association studies, gene finding and sequence alignment, protein structure prediction, design and analysis of microarray data, molecular evolution and phylogenetic trees, DNA topology, and data base search strategies. Both original research and review articles will be warmly received.

Contents

Andrej Aderhold, Dirk Husmeier and Marco Grzegorzczak

Statistical inference of regulatory networks for circadian regulation — 227

Sui-Pi Chen and Guan-Hua Huang

A Bayesian clustering approach for detecting gene-gene interactions in high-dimensional genotype data — 275

Jeffrey C. Miecznikowski and Daniel P. Gaile

A novel characterization of the generalized family wise error rate using empirical null distributions — 299

Jing Qiu, Yue Qi and Xiangqin Cui

Applying shrinkage variance estimators to the TOST test in high dimensional settings — 323

Murat Sariyar, Martin Schumacher and Harald Binder

A boosting approach for adapting the sparsity of risk prediction signatures based on different molecular levels — 343

Nubia E. Duarte, Suely R. Giolo, Alexandre C. Pereira, Mariza de Andrade and Júlia P. Soler

Using the theory of added-variable plot for linear mixed models to decompose genetic effects in family data — 359

Iain G. Johnston

Efficient parametric inference for stochastic biological systems with measured variability — 379
