

ACKNOWLEDGMENTS

Much of the information presented in this book was acquired through discussions with numerous colleagues and students during the authors' combined total of over 100 years of conducting research in and teaching about herpetology, and to all these talented people we express our heartfelt thanks. In this regard we are especially indebted to David Wake, Director Emeritus of the Museum of Vertebrate Zoology, University of California, Berkeley, for bringing us up to date on the rapidly evolving field of DNA-based species analysis in amphibians. We also thank Jackson D. Shedd, section editor of *Herpetological Review*, for his fine in-depth review of the manuscript. We would also like to thank Robert Hansen, editor of the *Herpetological Review*, for his helpful feedback on the manuscript.

The publication of amphibian and reptile color illustrations would not have been possible without the foresight of Kira Od, who realized the need for compiling a digital record of this one-of-a-kind art and then proceeded to accomplish this enormous task with true artistic precision before the originals were permanently archived. The assistance of Les Chibana in digitally adjusting each illustration at the direction of the artist is also appreciated. We are grateful to Lisa White, Houghton Mifflin field guide editor, for her generous permission for the use of many of the illustrations, and to Kate Hoffman, University of California Press project editor for science, whose periodic updates and suggestions along the lengthy path to publication are much appreciated.

We also thank editors Laura Cerruti, for her enthusiasm and guidance in the initiation of this project, and Kim Robinson, for moving it steadily down the home stretch. The authors assume that production editor Nancy Lombardi of P. M. Gordon Associates ranks their manuscript among her most challenging, and we appreciate her dedication and professional approach to editing our text.

The dedicated effort and Swiss precision that our graphic artist, Madeleine Van Der Heyden, applied to the production of the range maps and temperature profile graphs are outstanding. We also thank Carole Richmond for the use of her fine photo of slender salamander embryos.

This book would have never progressed beyond the scribbled note and poorly typed first draft stage without the editing, word processing, and Photoshop skills of Molly McGinnis. Her support and assistance along with that of Anna-rose Stebbins are greatly appreciated.
