Preface	v
I Basic equations of continuum mechanics	
1 Basic equations of continuous media	3
1.1 Methods of describing motion of continuous media	3
1.1.1 Coordinate systems and methods of describing motion of continuous media	3
1.1.2 Eulerian description	4
1.1.3 Lagrangian description	5
1.1.4 Differentiation of bases	5
1.1.5 Description of deformations and rates of deformation of a continuous medium	7
1.2 Conservation laws. Integral and differential forms	9
1.2.1 Integral form of conservation laws	9
1.2.2 Differential form of conservation laws	11
1.2.3 Conservation laws at solution discontinuities	13
1.2.4 Conclusions	14
1.3 Thermodynamics	15
1.3.1 First law of thermodynamics	15
1.3.2 Second law of thermodynamics	16
1.3.3 Conclusions	18
1.4 Constitutive equations	18
1.4.1 General form of constitutive equations. Internal variables	18
1.4.2 Equations of viscous compressible heat-conducting gases	21
1.4.3 Thermoelastic isotropic media	21
1.4.4 Combined media	22
1.4.5 Rigid-plastic media with translationally isotropic hardening	24
1.4.6 Elastoplastic model	25
1.5 Theory of plastic flow. Theory of internal variables	26
1.5.1 Statement of the problem. Equations of an elastoplastic medium	26
1.5.2 Equations of an elastoviscoplastic medium	30

1.6	Experimental determination of constitutive relations under dynamic loading	32
1.6.1	Experimental results and experimentally obtained constitutive equations	32
1.6.2	Substantiation of elastoviscoplastic equations on the basis of dislocation theory	36
1.7	Principle of virtual displacements. Weak solutions to equations of motion	40
1.7.1	Principles of virtual displacements and velocities	40
1.7.2	Weak formulation of the problem of continuum mechanics	42
1.8	Variational principles of continuum mechanics	43
1.8.1	Lagrange's variational principle	43
1.8.2	Hamilton's variational principle	44
1.8.3	Castigliano's variational principle	45
1.8.4	General variational principle for solving continuum mechanics problems	46
1.8.5	Estimation of solution error	49
1.9	Kinematics of continuous media. Finite deformations	49
1.9.1	Description of the motion of solids at large deformations	49
1.9.2	Motion: deformation and rotation	50
1.9.3	Strain measures. Green–Lagrange and Euler–Almansi strain tensors	52
1.9.4	Deformation of area and volume elements	53
1.9.5	Transformations: initial, reference, and intermediate configurations	54
1.9.6	Differentiation of tensors. Rate of deformation measures	55
1.10	Stress measures	57
1.10.1	Current configuration. Cauchy stress tensor	57
1.10.2	Current and initial configurations. The first and second Piola–Kirchhoff stress tensors	57
1.10.3	Measures of the rate of change of stress tensors	59
1.11	Variational principles for finite deformations	60
1.11.1	Principle of virtual work	60
1.11.2	Statement of the principle in increments	60
1.12	Constitutive equations of plasticity under finite deformations	61
1.12.1	Multiplicative decomposition. Deformation gradients	61
1.12.2	Material description	63
1.12.3	Spatial description	64
1.12.4	Elastic isotropic body	65

1.12.5 Hyperelastoplastic medium	66
1.12.6 The von Mises yield criterion	66

II Theory of finite-difference schemes

2 The basics of the theory of finite-difference schemes	71
2.1 Finite-difference approximations for differential operators	71
2.1.1 Finite-difference approximation	71
2.1.2 Estimation of approximation error	73
2.1.3 Richardson's extrapolation formula	77
2.2 Stability and convergence of finite difference equations	78
2.2.1 Stability	78
2.2.2 Lax convergence theorem	78
2.2.3 Example of an unstable finite difference scheme	79
2.3 Numerical integration of the Cauchy problem for systems of equations	81
2.3.1 Euler schemes	82
2.3.2 Adams–Bashforth scheme	83
2.3.3 Construction of higher-order schemes by series expansion	85
2.3.4 Runge–Kutta schemes	85
2.4 Cauchy problem for stiff systems of ordinary differential equations	88
2.4.1 Stiff systems of ordinary differential equations	88
2.4.2 Numerical solution	89
2.4.3 Stability analysis	90
2.4.4 Singularly perturbed systems	91
2.4.5 Extension of a rod made of a nonlinear viscoplastic material	92
2.5 Finite difference schemes for one-dimensional partial differential equations	95
2.5.1 Solution of the wave equation in displacements. The cross scheme	95
2.5.2 Solution of the wave equation as a system of first-order equations (acoustics equations)	96
2.5.3 The leapfrog scheme	97
2.5.4 The Lax–Friedrichs scheme	97
2.5.5 The Lax–Wendroff Scheme	98
2.5.6 Scheme viscosity	99
2.5.7 Solution of the wave equation. Implicit scheme	100
2.5.8 Solution of the wave equation. Comparison of explicit and implicit schemes. Boundary points	100
2.5.9 Heat equation	101
2.5.10 Unsteady thermal conduction. Explicit scheme (forward Euler scheme)	103

2.5.11	Unsteady thermal conduction. Implicit scheme (backward Euler scheme)	103
2.5.12	Unsteady thermal conduction. Crank–Nicolson scheme	103
2.5.13	Unsteady thermal conduction. Allen–Cheng explicit scheme	103
2.5.14	Unsteady thermal conduction. Du Fort–Frankel explicit scheme	104
2.5.15	Initial-boundary value problem of unsteady thermal conduction. Approximation of boundary conditions involving derivatives	104
2.6	Stability analysis for finite difference schemes	106
2.6.1	Stability of a two-layer finite difference scheme	107
2.6.2	The von Neumann stability condition	107
2.6.3	Stability of the wave equation	108
2.6.4	Stability of the wave equation as a system of first-order equations. The Courant stability condition	109
2.6.5	Stability of schemes for the heat equation	112
2.6.6	The principle of frozen coefficients	113
2.6.7	Stability in solving boundary value problems	115
2.6.8	Step size selection in an implicit scheme in solving the heat equation	116
2.6.9	Step size selection in solving the wave equation	117
2.7	Exercises	117
3	Methods for solving systems of algebraic equations	122
3.1	Matrix norm and condition number of matrix	122
3.1.1	Relative error of solution for perturbed right-hand sides. The condition number of a matrix	122
3.1.2	Relative error of solution for perturbed coefficient matrix	123
3.1.3	Example	124
3.1.4	Regularization of an ill-conditioned system of equations	125
3.2	Direct methods for linear system of equations	126
3.2.1	Gaussian elimination method. Matrix factorization	126
3.2.2	Gaussian elimination with partial pivoting	127
3.2.3	Cholesky decomposition. The square root method	128
3.3	Iterative methods for linear system of equations	130
3.3.1	Single-step iterative processes	130
3.3.2	Seidel and Jacobi iterative processes	131
3.3.3	The stabilization method	133
3.3.4	Optimization of the rate of convergence of a steady-state process	135
3.3.5	Optimization of unsteady processes	137

3.4	Methods for solving nonlinear equations	140
3.4.1	Nonlinear equations and iterative methods	140
3.4.2	Contractive mappings. The fixed point theorem	141
3.4.3	Method of simple iterations. Sufficient convergence condition	143
3.5	Nonlinear equations: Newton's method and its modifications	145
3.5.1	Newton's method	145
3.5.2	Modified Newton–Raphson method	147
3.5.3	The secant method	147
3.5.4	Two-stage iterative methods	148
3.5.5	Nonstationary Newton method. Optimal step selection	149
3.6	Methods of minimization of functions (descent methods)	152
3.6.1	The coordinate descent method	152
3.6.2	The steepest descent method	154
3.6.3	The conjugate gradient method	155
3.6.4	An iterative method using spectral-equivalent operators or reconditioning	156
3.7	Exercises	157
4	Methods for solving boundary value problems for systems of equations	160
4.1	Numerical solution of two-point boundary value problems	160
4.1.1	Stiff two-point boundary value problem	160
4.1.2	Method of initial parameters	161
4.2	General boundary value problem for systems of linear equations	163
4.3	General boundary value problem for systems of nonlinear equations	164
4.3.1	Shooting method	165
4.3.2	Quasi-linearization method	165
4.4	Solution of boundary value problems by the sweep method	166
4.4.1	Differential sweep	166
4.4.2	Solution of finite difference equation by the sweep method	170
4.4.3	Sweep method for the heat equation	171
4.5	Solution of boundary value problems for elliptic equations	172
4.5.1	Poisson's equation	172
4.5.2	Maximum principle for second-order finite difference equations	175
4.5.3	Stability of a finite difference scheme for Poisson's equation	176
4.5.4	Diagonal domination	176
4.5.5	Solution of Poisson's equation by the matrix sweep method	178
4.5.6	Fourier's method of separation of variables	181

4.6	Stiff boundary value problems	183
4.6.1	Stiff systems of differential equations	183
4.6.2	Generalized method of initial parameters	185
4.6.3	Orthogonal sweep	186
4.7	Exercises	189

III Finite-difference methods for solving nonlinear evolution equations of continuum mechanics

5	Wave propagation problems	197
5.1	Linear vibrations of elastic beams	197
5.1.1	Longitudinal vibrations	197
5.1.2	Explicit scheme. Sufficient stability conditions	197
5.1.3	Longitudinal vibrations. Implicit scheme	199
5.1.4	Transverse vibrations	200
5.1.5	Transverse vibrations. Explicit scheme	202
5.1.6	Transverse vibrations. Implicit scheme	203
5.1.7	Coupled longitudinal and transverse vibrations	204
5.1.8	Transverse bending of a plate with shear and rotational inertia	206
5.1.9	Conclusion	209
5.2	Solution of nonlinear wave propagation problems	209
5.2.1	Hyperbolic system of equations and characteristics	209
5.2.2	Finite difference approximation along characteristics. The direct and semi-inverse methods	211
5.2.3	Inverse method. The Courant–Isaacson–Rees grid-characteristic scheme	211
5.2.4	Wave propagation in a nonlinear elastic beam	212
5.2.5	Wave propagation in an elastoviscoplastic beam	215
5.2.6	Discontinuous solutions. Constant coefficient equation	219
5.2.7	Discontinuous solutions of a nonlinear equation	220
5.2.8	Stability of difference characteristic equations	222
5.2.9	Characteristic and grid-characteristic schemes for solving stiff problems	222
5.2.10	Stability of characteristic and grid-characteristic schemes for stiff problems	224
5.2.11	Characteristic schemes of higher orders of accuracy	225
5.3	Two- and three-dimensional characteristic schemes and their application	227
5.3.1	Spatial characteristics	227
5.3.2	Basic equations of elastoviscoplastic media	229

5.3.3	Spatial three-dimensional characteristics for semi-linear system	231
5.3.4	Characteristic equations. Spatial problem	235
5.3.5	Axisymmetric problem	236
5.3.6	Difference equations. Axisymmetric problem	238
5.3.7	A brief overview of the results. Further development and generalization of the method of spatial characteristics and its application to the solution of dynamic problems	244
5.4	Coupled thermomechanics problems	245
5.5	Differential approximation for difference equations	248
5.5.1	Hyperbolic and parabolic forms of differential approximation	248
5.5.2	Example	249
5.5.3	Stability	250
5.5.4	Analysis of dissipative and dispersive properties	251
5.5.5	Example	253
5.5.6	Analysis of properties of finite difference schemes for discontinuous solutions	254
5.5.7	Smoothing of non-physical perturbations in a calculation on a real grid	259
5.6	Exercises	260
6	Finite-difference splitting method for solving dynamic problems	263
6.1	General scheme of the splitting method	263
6.1.1	Explicit splitting scheme	263
6.1.2	Implicit splitting scheme	264
6.1.3	Stability	265
6.2	Splitting of 2D/3D equations into 1D equations (splitting along directions)	265
6.2.1	Splitting along directions of initial-boundary value problems for the heat equation	265
6.2.2	Splitting schemes for the wave equation	268
6.3	Splitting of constitutive equations for complex rheological models into simple ones. A splitting scheme for a viscous fluid	270
6.3.1	Divergence form of equations	270
6.3.2	Non-divergence form of equations	272
6.3.3	One-dimensional equations. Ideal gas	273
6.3.4	Implementation of the scheme	275
6.4	Splitting scheme for elastoviscoplastic dynamic problems	276
6.4.1	Constitutive equations of elastoplastic media	276
6.4.2	Some approaches to solving elastoplastic equations	277
6.4.3	Splitting of the constitutive equations	279

6.4.4	The theory of von Mises type flows. Isotropic hardening	281
6.4.5	Drucker–Prager plasticity theory	283
6.4.6	Elastoviscoplastic media	285
6.5	Splitting schemes for points on the axis of revolution	286
6.5.1	Calculation of boundary points	286
6.5.2	Calculation of axial points	288
6.6	Integration of elastoviscoplastic flow equations by variation inequality	290
6.6.1	Variation inequality	290
6.6.2	Dissipative schemes	292
6.7	Exercises	295
7	Solution of elastoplastic dynamic and quasistatic problems with finite deformations	298
7.1	Conservative approximations on curvilinear Lagrangian meshes	298
7.1.1	Formulas for natural approximation of spatial derivatives	298
7.1.2	Approximation of a Lagrangian mesh	299
7.1.3	Conservative finite difference schemes	301
7.2	Finite elastoplastic deformations	303
7.2.1	Conservative schemes in one-dimensional case	303
7.2.2	A conservative two-dimensional scheme for an elastoplastic medium	305
7.2.3	Splitting of the equations of a hypoelastic material	306
7.3	Propagation of coupled thermomechanical perturbations in gases	307
7.3.1	Basic equations	307
7.3.2	Conservative finite difference scheme	307
7.3.3	Non-divergence form of the energy equation. A completely conservative scheme	309
7.4	The PIC method and its modifications for solid mechanics problems	311
7.4.1	Disadvantages of Lagrangian and Eulerian meshes	311
7.4.2	The particle-in-cell (PIC) method	311
7.4.3	The method of coarse particles	314
7.4.4	Limitations of the PIC method and its modifications	315
7.4.5	The combined flux and particle-in-cell (FPIC) method	316
7.4.6	The method of markers and fluxes	317
7.5	Application of PIC-type methods to solving elastoviscoplastic problems	317
7.5.1	Hypoelastic medium	318
7.5.2	Hypoelastoplastic medium	319
7.5.3	Splitting for a hyperelastoplastic medium	321

7.6	Optimization of moving one-dimensional meshes	324
7.6.1	Optimal mesh for a given function	325
7.6.2	Optimal mesh for solving an initial-boundary value problem	326
7.6.3	Mesh optimization in several parameters	327
7.6.4	Heat propagation from a combustion source	328
7.7	Adaptive 2D/3D meshes for finite deformation problems	330
7.7.1	Methods for reorganization of a Lagrangian mesh	330
7.7.2	Description of motion in an arbitrary moving coordinate system	331
7.7.3	Adaptive meshes	333
7.8	Unsteady elastoviscoplastic problems on moving adaptive meshes	335
7.8.1	Algorithms for constructing moving meshes	335
7.8.2	Selection of a finite difference scheme	337
7.8.3	A hybrid scheme of variable order of approximation at internal nodes	339
7.8.4	A grid-characteristic scheme at boundary nodes	341
7.8.5	Calculation of contact boundaries	344
7.8.6	Calculation of damage kinetics	346
7.8.7	Numerical results for some applied problems with finite elastoviscoplastic strains	347
7.9	Exercises	352
8	Modeling of damage and fracture of inelastic materials and structures	354
8.1	Concept of damage and the construction of models of damaged media	354
8.1.1	Concept of continuum fracture and damage	354
8.1.2	Construction of damage models	355
8.1.3	Constitutive equations of the GTN model	361
8.2	Generalized micromechanical multiscale damage model	363
8.2.1	Micromechanical model. The stage of plastic flow and hardening	364
8.2.2	Stage of void nucleation	365
8.2.3	Stage of the appearance of voids and damage	366
8.2.4	Relationship between micro and macro parameters	367
8.2.5	Macromodel	368
8.2.6	Tension of a thin rod with a constant strain rate	373
8.2.7	Conclusion	375
8.3	Numerical modeling of damaged elastoplastic materials	375
8.3.1	Regularization of equations for elastoplastic materials at softening	375
8.3.2	Solution of damage problems	376
8.3.3	Inverse Euler method	377

8.3.4	Solution of a boundary value problem. Computation of the Jacobian	379
8.3.5	Splitting method	379
8.3.6	Integration of the constitutive relations of the GTN model	382
8.3.7	Uniaxial tension. Computational results	386
8.3.8	Bending of a plate	387
8.3.9	Comparison with experiment	389
8.3.10	Modeling quasi-brittle fracture with damage	390
8.4	Extension of damage theory to the case of an arbitrary stress-strain state	393
8.4.1	Well-posedness of the problem	394
8.4.2	Limitations of the GTN model	395
8.4.3	Associated viscoplastic law	396
8.4.4	Constitutive relations in the absence of porosity ($k < 0.4$, $f = 0$, $\sigma_r = 0$)	396
8.4.5	Fracture model. Fracture criteria	397
8.5	Numerical modeling of cutting of elastoviscoplastic materials	398
8.5.1	Introduction	398
8.5.2	Statement of the problem	399
8.6	Conclusions. General remarks on elastoplastic equations	406
8.6.1	Formulations of systems of equations for elastoplastic media	406
8.6.2	A hardening elastoplastic medium	406
8.6.3	Ideal elastoplastic media: a degenerate case	407
8.6.4	Difficulties in solving mixed elliptic-hyperbolic problems	408
8.6.5	Regularization of an elastoplastic model	408
8.6.6	Elastoplastic shock waves	409
	Bibliography	411
	Index	421
